

Figure 5: TextView with title

Figure 6: Component 1

Figure 7: Component 2

- Obtain a reference to the *Calculate* button so you can assign an *OnClickListener()* to the button. This catches the click event of the button, and makes the user override the *onClick()* method of the listener.

```
messageBox.setOnClickListener(new OnClickListener() {
    public void onClick(View v) {
    }
})
```

- Perform basic validations for NULL values, on the contents of the *EditText* elements.
- Use the *Double* wrapper class to convert the string values to their actual *Double* values.
- If any error occurs, display a Toast message—a pop-up message telling the user about the error.
- If all the validations are passed, then *calculate* the simple interest and display it in an *alert* dialogue box. The syntax used to show the *AlertDialog* is as follows:

```
// prepare the alert box
AlertDialog.Builder alertbox = new AlertDialog.Builder(v.getContext());
System.out.println("Alert builder");
// set the message to display
alertbox.setMessage("Simple Interest = " + si.toString());
// add a neutral button to the alert box and assign a click listener
alertbox.setNeutralButton("Ok", new DialogInterface.OnClickListener() {
    // click listener on the alert box
    public void onClick(DialogInterface arg0, int arg1) {
        // the button was clicked
        Toast.makeText(getApplicationContext(), "Thank You !!!!",
            Toast.LENGTH_LONG).show();
    }
});
// show it
alertbox.show();
```

Figure 8: The resultant AlertDialog

I have created a screen cast of this application (<http://goo.gl/DPaO>), which provides a visual overview of it and enables you to understand it better.

This was a simple example of Android application development. So there is a lot more to Android than meets the eye!
