

VSS Mani (Founder & CEO of Justdial)

challenges like taking care of the linguistic aspects of the search process. A centralised call centre approach for the phone service, too, would have resulted in too many linguistic problems. Besides, the company believed in the human touch, wherein technologies ought to work around people and not the other way round (where technology is forced down people). Thus, an open and distributed architecture was a perfect fit for Just Dial.

"We typically didn't want our Web service and call centre to be dependant on a client server architecture, as maintaining it would be cumbersome compared to the Web-based open architecture. Our traditional client servers were also having performance issues, slowing down the system. This was hindering prompt service delivery. As we planned our movement to the Web world, we expected as many queries on the website as via the telephone route, which would result in a huge performance pressure on our search algorithms. We knew the traditional client server architecture would collapse and thus opted for open and distributed architecture," says Chattopadhyay. "Also, the way we leveraged Web 2.0 technology, it was very light on the network and could be easily sustained even on the meagre 10 MB architecture we had back then," he adds.

Alongside this, on the software side, the firm adopted the CLAMP stack, which

was a combination of C and the LAMP (Linux, Apache, MySQL, PHP) stack. About 200 servers, connecting 3,500 workstations at Just Dial, are powered by this CLAMP stack today. "The LAMP stack is well known for its robustness, reliability, etc, which is why we decided to adopt it. We didn't want to upset or play around with a stack that works so beautifully. For instance, for every kernel module that we wanted to patch onto a Web server, Apache Web support was there. So was the case for MySQL, which fitted perfectly with our search, which is parameterised, and based on advanced artificial intelligence principles. Further, MySQL and Red Hat made an awesome combo. Thus, LAMP was the de facto standard for us. However, we did add a lot of C components into the kernel itself to make the stack even more optimal," says Chattopadhyay.

Just Dial chose Red Hat Enterprise Linux (RHEL) to power its servers, Ubuntu on the desktop front, MySQL, Postgres and MongoDB for database management, and WebHuddle for Web conferencing and video conferencing. While performance, security of the platform and trust in Red Hat made Just Dial bet on RHEL, the optimal network stack in Ubuntu won Just Dial's confidence in the Ubuntu OS. "When we were choosing an open source application platform, we were looking at two criteria

IPSR

launches

RHCVA

(Red Hat Certified Virtualization Administrator)

Special OFFERS for RHCVA RHCSS

Get trained by faculty team headed by RHCVA Certified professionals

Red Hat Certification Exams EVERY WEEK!

Advantage RHCVA

- There are no prerequisites for this certification. Any candidate who has knowledge in System Administration (Windows / Linux / Unix / Sun Solaris) can opt for this certification
- The certification consists of just 1 module

RHCE RHCSS RHCDS RHCA

Awards

- Winner of Red Hat Asia Pacific International Award 08 & 09
- Winner of Red Hat GLS National Awards 04, 05, 06, 07 & 08

Faculty & Infrastructure

- 15 member faculty crewed by RHCE, RHCVA, RHCSS, RHCDS, RHCA certified professionals
- Global standard infrastructure offered at our International Centre located in Kochi

Achievements

- Produced 2500+ RHCEs & 24 RHCSSs as of June 2010, the highest in the World by a single partner
- Produced the youngest RHCE (11 years old) & Youngest RHCSS (13 years old)
