

Figure 1: USB Startup Disk Creator

Figure 2: Contents of casper folder on startup disk

- The kernel parameter `cdrom-detect/try-usb=true` specifies that if the kernel file is not found on a CD-ROM, try a USB location as a fall-back.
 - The kernel parameter `i915.modeset=1` prevents Ubuntu 10.04 from having problems with old Intel graphics chip-sets like the i915 chip-set.
7. Reboot the computer (in my case, my laptop). You will be presented with a Grub menu from the USB pen drive; select the first option to boot into a live session of Ubuntu 10.04.
 8. Click the 'Install Ubuntu 10.04' icon on your desktop to launch the installer, and install Ubuntu as per your preferences (overwriting an existing installation, or into a new partition).
 9. When the installation is done, restart the computer, as usual. You could remove the USB drive, but even if you leave

Figure 3: GRUB menu

Figure 4: Edit kernel boot options

- it in, there shouldn't be a problem. Ubuntu 10.04's boot loader will now be in control, and it doesn't have an option to boot from the USB drive. 9.04's boot loader will be inactive, and thus would not cause the system to boot from the USB drive. And since your computer BIOS anyway lacks a boot-from-USB option, the BIOS won't boot from the USB drive either. See Figure 3 for the Grub boot menu.
10. If you have one of the old Intel video chip-sets mentioned earlier, at the Grub menu, press 'e' to edit kernel parameters, and add the `i915.modeset=1` option. See Figure 4 for an example.
 11. Now enjoy the great new Ubuntu desktop! **END**
