

Keryx

Your Life-changing Messenger

In countries like India, where broadband penetration is very low, Linux users find it difficult to grab updates, or install those missing codecs. This article offers a way around the problem.

We all admire the simplicity of how some operating systems install software via a single installer downloaded on another system, and which is then copied onto the target system. Us, Linux users have been trapped in a seemingly never-ending chain of dependencies. We cannot simply download a package file on a public computer and install it on an offline system, due to the often-complex inter-dependency of Linux packages. Though

this dependency system was designed to make package management more efficient, it also complicated the process of installing new software on a system that had low-speed or no connectivity to the Net.

Here's Keryx !

Luckily, Keryx (a small program written in wxPython), makes Linux life easier. Keryx, meaning 'messenger', can be used to update Linux systems that don't have a Net connection,
