NComputing is a desktop virtualisation company that manufactures hardware and software to create virtual desktops, which enable multiple users to simultaneously share one computer. The company's approach is similar to thin clients, but promises better media streaming and audio performance with lower costs.

The combination of NComputing hardware (access devices) and virtualisation software (vSpace) uses the excess computing capacity of one PC to create multiple virtual desktops. The vSpace software allows multiple user accounts to run simultaneously on a single computer. The access devices connect each user's keyboard, monitor, and mouse to the shared PC. Each NComputing access device has ports for a keyboard, monitor and mouse, but does not contain a CPU or memory.

NComputing has X-series, L-series and U-series devices. The X-series access devices connect via a CAT 5 cable to a PCI card that is installed in a shared PC. Since there are typically two free PCI ports in a PC, the technology supports up to two PCI cards. The maximum distance between the PC and an access device is 10 m, or about 30 feet. The X-series comes in kits, which include one PC card and several access terminals, depending on the specific product.

Requirements

- NComputing x550 device
- EduBOSS 1.0
- A server system with:
 - One or more PCI card slots
 - Minimum 1 GB RAM
 - Core 2 Duo processor
 - 50 GB hard disk space (depending on user requirements)
- Client system requirement:
 - Monitor
 - PS/2 mouse and keyboard
- X-series package

Key features

- One PC can be shared by up to 11 users
- Hardware and support costs get slashed by up to 75 per cent
- More energy efficient

Procedure

- 1) Install EduBOSS 1.0 version, which can be downloaded from <ftp://images.bosslinux.in/ISO%20Images/EduBOSS/eduboss-1.0-i386-DVD.iso>
- 2) Install kernel 2.6.24.3, which can be downloaded from ftp://images.bosslinux.in/ncomputing/linux-image-2.6.24.3_2.6.24.3-10.00.Custom_i386.deb

`dpkg -i linux-image-2.6.24.3_2.6.24.3-10.00.Custom_i386.deb`
