450,000 Android-compatible apps available from third-party software developers in comparison to the 550,000 apps that are available for Apple iOS devices.

Of late, Google has also enhanced and enriched its offerings in the Android Market, and has also included digital books, music and video.

Instagram for Android to shortly arrive on your device

The popular free photo sharing application, Instagram, will soon come to your Android devices too. Till now, the service that allows you to transform your pictures with interesting features had been available only for iOS. The founder of Instagram, Kevin Systrom, recently announced that Instagram for Android is currently in private beta testing.

Instagram was released for iOS in October 2010 and was an instant hit, notching up 25 million users till date. But the company took quite some time to develop the app for Android. That Instagram was coming to Android was first heard in December last year but the company subsequently was silent for a while.

New mass injection wave of WordPress websites on the prowl

The Websense ThreatSeeker Network has detected a new wave of mass-injections of a well-known exploit that the Websense Security Labs (TM) has been following for months. The majority of targets are websites hosted by the WordPress content management system. More than 200,000 Web pages have been compromised, amounting to close to 30,000 unique websites (hosts).

The injection hijacks visitors to the compromised sites and redirects them to rogue AV sites that attempt to trick them into downloading and installing a Trojan onto their computer.

Fedora Remix for Raspberry Pi now available

The Raspberry Pi Foundation has released the Fedora Remix designed for its Raspberry Pi microcomputer. The remix is a distribution comprising software packages from the Fedora ARM project, plus a small number of additional packages that are modified from the Fedora versions or which cannot be included in Fedora due to licensing issues – in particular, the libraries for accessing the VideoCore GPU on the Raspberry Pi, said sources at the Foundation.

The current version of the remix is based on Fedora 14. However, the foundation expects to announce a version based on Fedora 17 at the same time as the desktop version is launched. "The Fedora ARM project is hard at work building Fedora 17, which we hope to release concurrently with the PC versions in May. This should be the most complete Fedora ARM release produced to date. Students in the SBR600 course at Seneca College are working on an improved version of the Remix incorporating files from Fedora ARM 17, and this will also be released in May," the Foundation said.

The Raspberry Pi Fedora Remix is available as an SD card image, which includes a little over 640 packages. It provides both text-mode and graphical interfaces (LXDE/XFCE) with an assortment of programming languages, applications, system tools, and services for both environments.

"There are over 16,000 software packages available from the Fedora ARM repositories that can be easily installed using the Internet to customise your system to meet your needs and interests (again, using either command-line or graphical tools)," report sources in the Raspberry Pi Foundation.
