

Winner Takes All WordPress vs Drupal vs Joomla!

In this article, we take a look at WordPress, Drupal and Joomla! to determine which of the three CMSs is leading the race in terms of specific usage.

When it comes to CMSs, WordPress, Joomla! and Drupal are the three leading names today. All three are open source software, and are free to use and customise. Each has its own community and user base, as well as a well-maintained repository of themes/templates and plug-ins/extensions. And all three have their pros and cons.

But before we go any further, it is worthwhile to point out that using (or not using) a particular CMS also involves a matter of personal taste. What works well for me may not work for you! Thus, if Drupal is already your favourite, and you hate WordPress—or vice-versa—this article does not intend to belittle or alter your preferences. The aim here is to simply compare three of the most popular CMSs.

The prelude

WordPress

WordPress began as a blogging tool, but of late, has evolved into a full-fledged CMS powering the likes of The New York Times (Blogs), The Lance Armstrong Foundation, Miley Cyrus, Sylvester Stallone, Harvard Gazette, Mashable and,

if I may add, *LINUX For You*. So if you're using WordPress, you sure are in good company! You can disable comments/track-backs, use static pages, and tweak your website by using widgets and plug-ins.

Make no mistake about it: WordPress has the easiest interface (as compared to most other CMSs). Furthermore, it also has many plug-ins and themes that can help you customise your website even if you are not comfortable with code and Web development. In fact, WordPress has the shallowest learning curve of all the three CMSs under review. Plus, the official documentation is so well supplemented by several community blogs all across the Internet that if you ever run into any trouble, you can be sure that help is at hand.

WordPress is in active development, and fixes/patches are released frequently. On the downside, these patches seem even more necessary for WordPress because it appears to be more vulnerable in matters of security compared to Drupal or Joomla!—over 50,000 WP websites are infected with spam. However, this number can also be attributed to the fact that WordPress is the most popular CMS out there, and thus, is more prone to such attacks.
