

Figure 16: The cube shaped like a wall

Figure 18: Creating a window

Figure 17: Top view

Figure 19: A preview

and create a cube covering the whole of the front viewport. Scale it to a rectangular shape. Now shift to the top viewport and scale down the cube to shape it like a wall that appears from the top, as in Figure 16 and Figure 17.

Viewing it from a different perspective shows you the cube in the shape of a rectangular wall. Shift back to the top viewport and create a cube so that it is centered in the viewport and shows up on both sides of the wall. Go to the front viewport and scale it to give it the shape of a window as in Figure 18.

Now we are ready for a Boolean operation. Shift select the second cube (window shape) and then shift select the first cube (the wall). Go to the *Tools* menu and click the entry that says 'Boolean Modeling'. A dialogue box pops up asking you to specify the kind of Boolean operation you wish to apply to the selected geometry. Select *Second-First* from the drop down menu (this is because we have selected the second cube first). When you accept the settings and click *OK*, a preview is shown in a small window and you know that the operation has been successfully carried out as shown in Figure 19.

Now we have an aperture for the window. We need a few cylinders to create the window bars. Make an elongated cylinder

shape and copy it several times to make the bars. Place these bars in the appropriate positions in the window as shown in Figure 20.

Since we will have only the close-up rendering of our scene, we need not worry about making the whole monastic cell. Let us add the appropriate texture to the wall so that it gives the appearance of belonging to an ancient stone cell. The floor also need not be created because it will be kept out of our scene. Without creating any more objects (which would otherwise complicate the scene, making it tedious for a novice), let us now concentrate on texturing the objects we have created so far.

Figure 21 shows you our scene without any textures applied to it.

Texturing the objects

Before we begin to texture the objects that we created, we should understand the methods of texturing that *The Art of Illusion* has to offer. Artists not familiar with this program will be surprised to find that texturing is great in *The Art of Illusion*, with the one exception that UV map creation and exporting is still under development. Texturing is done in two ways. The first is by using a simple texture and the second is by employing layered textures. It is possible to work further
