

Figure 24: Rendered image

Figure 25: A satisfactory output

and *cylindrical* do not give the papaya the proper aligned texturing, then you could select *UV* texturing and even adjust the UV layout. Once you are satisfied with aligning and fixing the seams that might show up in your texturing, click *OK* to accept the settings and close the dialogue box. Make a quick render to see the result as shown in Figure 24.

If you are satisfied with the appearance of the fruit, go ahead and texture all the objects in a similar fashion till you are done with the texturing.

Composing the scene

Before we render the scene, let us arrange the objects and compose the scene with a few lights and the default camera. Switch to the front viewport and place the table in front of the window such that the base of the window is aligned to the table top. Now place the fruit bowl in the centre of the table and place the papaya in the bowl in a reclining position. Switch to the camera view and zoom in so that only a part of the wall, including the window, the table, the bowl and the papaya, are visible. We have just composed our scene, which we can call, 'Papaya in

Figure 26: Final output

the Monastic Cell'. This completed scene that we have composed is now ready to be rendered (after we have set up the lights).

Setting up the lights and rendering

Setting up the lights and the camera are the most significant tasks of shooting a scene. The light has to be appropriate and sufficient in intensity. The type of light to be used will again differ based on the effect we want for the scene. We require just two lights for the spot just a little above the table. Move the default setting to the right, placing it next to the fruit bowl. Create another light and position it to the extreme left, near the edge of the table. Set the intensity of your lights to somewhere between 1 and 2. Do a test render. It appears okay but not satisfactory as in Figure 25.

Another great quality about *The Art of Illusion* is that it has some inbuilt filters for post processing (which is usually done in Photoshop or the Gimp).

In the picture that you have just rendered, click the button *Filter* and adjust the parameters like *Brightness*, *Saturation*, *Exposure Correction* and *Tint* till you are satisfied with your image. Now do a render. It is magical and enhances our realism as in Figure 26.

In this way, by adjusting various parameters while rendering, you could achieve great looking professional-quality effects. Bye for now. I hope you liked this short guide on creating digital art the easy way in *The Art of Illusion*.
