

“2012 is about making life easier for developers and for those in operations.”

The JBoss' Users and Developers Conference (JUDCon) was held in January at Bangalore, and featured discussions by top open source developers from around the world. Bruno Georges, currently heading Red Hat's Enterprise Application Platforms Engineering group, shed light on the recently launched JBoss Application Server (AS) 7. Georges, along with Sudhir D, QE manager, Red Hat India, spoke about its new features, and about their views on the Indian open source community and market.

Q Please define what the JBoss Enterprise Application Platform Engineering Group does?

The team consists of open source developers, quality engineers, a documentation team and a translation group. The community develops the program upstream, www.jboss.org.

Later, we do a process called hardening, and the Enterprise Application Platform (EAP) comes into place here. The team also performs quality analysis, quality engineering, localisation, and documentation for the open source component. The hardening process continues if the certification is on different operating systems, hardware, and Java Virtual Machines (JVM).

Q Could you elaborate on the recently introduced JBoss AS 7?

JBoss AS 7 was launched in July 2011. Hence, 2012 is about making life easier for developers, and also for those in operations. Since operations require more manageable and scalable solutions, we have introduced some concepts and features into the new platforms. Some of the core features that stand out in the AS 7 version are its high speed, light weight, fast deployment, management operation-friendliness, and its productivity.

Q Why would a customer prefer JBoss 7 over other open source alternatives?

Red Hat has made a large investment to empower developers with everything they need to develop, deploy and deliver applications. JBoss AS 7 addresses developers' concerns from tuning to projection—whether they want to deploy on the mobile, or on the cloud. That is why a developer would choose our platform. We also have an EE6 profile certification.

Q What led JBoss to the idea of AS 7?

In early 2009, we started discussing the future of JBoss 6 and JBoss AS. Since more buyers had been showing an interest in mobile and cloud computing, we wanted to change some aspects of JBoss AS to hit a different market. Towards the end of 2009, we started the first iteration of AS7, and started to work towards EE6 profile certifications. The first profile certified AS7.0 EE6 came out last year in July. The new AS 7, which was presented at the conference, focuses on developer productivity. Here, the developers did not just develop it, but deployed it towards the cloud and mobile applications. We aim to make such activities easier. We are currently working on
