TIME-LINE APPS

A New Era in Developing Facebook Apps

Dive into the world of social Web development to explore the new features released by the Facebook platform, and the new timeline interface. Here's a look at how adding a social aspect to your Web application can be good for how it evolves.

Facebook is where many of us spend a large part of our lives. The company has been making some major changes about the way we interact with applications, and the way we interact with each other. The new time-line feature has opened up a wide variety of ways in which we can create innovative applications, and this is exactly what we are going to look at in this article. The new open graph platform has allowed a user to do more than just *like* or *share* something. We can now *read* articles, *listen* to music and perform almost any action that the app developer has defined. This is basically achieved using a subject-predicate-object

or user-action-object architecture, where you define a set of actions that a user can perform, and a set of objects that the user can interact with. These actions can be reflected in a number of ways, like the time-line view, application view, newsfeed, ticker, etc.

As discussed before, at the core of any new Facebook application is the open graph protocol. This protocol intersects with the various Semantic Web technologies, which enable us to represent any Web page or piece of information as an object. Of course, these objects have some properties that Facebook users interact with, and this exposes the Facebook
