

Zorin OS 6 makes Windows to Linux transition easy!

Tech lovers can now be more gung-ho about switching over to the Linux platform. While there are existing user friendly distros such as Ubuntu Linux and Linux Mint, Zorin OS 6 is specifically designed to make the Windows to Linux switch smooth. No wonder, this Ubuntu-based Linux distribution is called the 'gateway to Linux for Windows users'.

The platform offers a new desktop environment, a multiple interface option, a browser manager, a five-year security guarantee and lots of updates.

Flipboard for Android

Flipboard, the much talked about news reading consumption application, which was earlier only on the iOS platform, has finally arrived on Android too. Flipboard for Android can be downloaded from Google's Play Store. This application converts Web content to a magazine format, and the interface was initially launched for iPad only. The Android version of the application also be downloaded from the Amazon App store & from Nook Apps for users of Kindle Fire and the tablet in the United States.

Check out Red Hat's JBoss Enterprise Application Platform 6

Tech lovers have a reason to feel good. Red Hat, Inc., the world's leading provider of open source solutions, announced the general availability of JBoss Enterprise Application Platform 6, which features a new cloud-ready architecture, new and improved management capabilities and significantly enhanced usability. This will help enterprises and their developers decrease time-to-market for application delivery and reduce the operational costs.

JBoss Enterprise Application Platform 6 provides developers and enterprises with a high-performance, low-footprint, easy-to-manage solution designed to help enterprises build applications with ease on the cloud. The new platform offers greater agility than previous versions of the solution, allowing customers to move their application development and deployment to the cloud without the need to re-skill or diverge from open industry standards. Platform 6 is the run-time engine that drives Java workloads in Red Hat OpenShift, Red Hat's Platform-as-a-Service (PaaS) offering.

Here's an open source version of webOS

Hewlett-Packard has released an open source version of webOS that can be used on legacy TouchPad tablets, the Open webOS project team announced recently. The 'Community Edition' enables users to learn how the TouchPad works and how to modify the device.

The code can be used to modify TouchPads in order to let developers learn how the OS works and prepare them to apply that knowledge to Open webOS 1.0 in the future, the team said on their website. Developers can use the Community Edition release to modify the card view, launcher and notifications, among other things.

The source code was made available online for download and can be used under the Apache License, Version 2.0, which is one of the more permissive licences, allowing developers to mix open source code with their own inventions and sell products using the combined code.

The Open webOS team worked closely with the webOS Internals team to release the Community Edition. The release of webOS Community Edition comes in the run-up to the release of Open webOS 1.0, planned for September 2012. The 1.0 release will include modernised technologies to enable developers to port webOS to their own hardware, according to the team. Besides, the September release will allow developers to integrate open source technologies such as the BlueZ Linux Bluetooth protocol stack and the GStreamer open source multimedia framework.
