

ESDS bags Business & Service Excellence award!

ESDS Software Solution Pvt Ltd, led by entrepreneur Piyush Somani, has bagged yet another prestigious award for the 'Most Promising Banking Technology Solutions & Services Provider' at the 'Business & Service Excellence Awards 2012' held at Navi Mumbai. The award was presented by actor Anupam Kher in the presence of a distinguished gathering.

The 'Business & Service Excellence Awards' are conducted annually by BIG Brands Research, an organisation with several business interests including market research and brand management. These awards are given to businesses and professionals annually, based on their service quality, leadership position in the industry, dedication to customer satisfaction, positive entrepreneurial initiatives, exemplary business practices, feedback from the end customers and the business' growth.

ESDS has been conferred the 'Most Promising Banking Technology Solutions & Services Provider' for the giant strides it has taken in the last couple of years to augment its services portfolio to the Indian banking sector. ESDS offers end-to-end core banking services along with microfinance and financial inclusion services, all at an affordable cost. The banking industry has evolved over a fairly short period and grown exponentially around an entire gamut of products. ESDS claims to provide the banking sector with the right products, through the right channels, 24/7.

ESDS' suite of services include its core banking offering for banks and credit societies, hosted core banking solutions or SaaS, Disaster Recovery as a Service (DRaaS), data centre turnkey solutions, data centre hosting for banks and financial institutions, and document management systems. Sources at ESDS claim that its DRaaS, which is called eNlight Cloud, saves up to 90 per cent of typical DR costs. It is a completely automated solution, and cuts the time required to set up a DR site and restore the main site in case a disaster strikes. eNlight Cloud enables banks to utilise a single DR site to act as a backup for multiple bank branches across the globe. The company claims that this solution can save 50-85 per cent of the hardware costs since only one DR site takes care of all the branches.

To judge the winners from among various nominated companies and professionals, BIG Brands Research conducted a study for over six months and with more than 50 field executives collecting the data from across the different cities in Maharashtra and Goa. The primary objectives of this comprehensive market research study were to identify and acknowledge service excellence, the associated innovations and best practices that lead to exemplary performance, and to highlight the importance of pursuing customer satisfaction in today's competitive and ever-evolving business environment.

Said Piyush Somani, CEO and MD of ESDS, "It is an extremely proud moment for ESDS to be conferred this award and this will further boost the resolve of our team to work even harder in the future."

Get the Samsung Galaxy Note with an updated OS

Samsung Galaxy Note users waited long enough for their dose of Ice Cream Sandwich, which they finally received this May. To make up for the delayed update, the company had promised some very interesting features for device owners, like the S Pen. And while you may still be relishing those add-ons, here comes some more delightful news for Note owners... Samsung has announced yet another upgrade for the Galaxy Note that has a few tweaks and improvements for the OS of the smartphone.

This update has a few more features that are inspired by the recently launched Samsung Galaxy SIII. Moreover, the OS version of your device will go from ICS 4.0.3 to 4.0.4. As part of this update, Samsung has added a 'Video POP-up Play' feature, which enables users to play a video while working on other apps. This will ensure that you never miss any e-mail or text message while watching your favourite video.

The second feature that needs special mention is the Signature Unlock function—you can simply sign your name using Samsung S Pen to gain access to the phone's contents, along with the traditional PIN or Pattern Lock security features.
