of the firm, "With more tablets entering the market, product awareness and tech knowledge are on the rise among users. Now there is a tablet for every budget, and with the entry of many promising domestic players, the market will undergo a significant change. We see other brands that offer the Android OS as competition since many of them offer the same features we do in terms of hardware, software,

multimedia usage, apps, etc. But we definitely have an extra edge, as we are the pioneers of the 4.0 ICS low-cost tablet in India."

Android on the go

Blessed with several nifty and inimitable features, the Android OS has caught the imagination of the young tech junkies. That probably explains why it is easy to see Android tablets topping the popularity charts among gadget freaks. So what makes Android so special? Is it cost effectiveness or something beyond that? Asus, which launched its Eee Pad Transformer Prime with a fabulous 3D graphics performance that has previously never been seen on a tablet, is gung-ho about Google's OS. "Android is a multi-channel, multi-carrier OS. It facilitates users in many aspects like security, privacy, speed, updated user interface design, audio, graphics, and input enhancements for game developers, etc. Android tablets are packed with the

security and other exciting features that promise to deliver the most complete computing and satisfying experience," says Alex Huang, country manager, System Business Group, ASUS India.

With the Android OS swamping the tablet market and sending the cash registers ringing, how do buyers differentiate between brands?

Sushmita Das, country manager India, Kobian Pvt Ltd, which recently launched the Android 4.0-based mTab Rio, comes up with a remarkable answer. "A tablet has three main features that decide its position in the market—the display, the processor and connectivity. We understand the market and the product as we are the manufacturers who work closely with technology

leaders. We believe in making technology simpler, and our focus on improving and innovating on the above three parameters helps us to differentiate ourselves in the crowded tablet marketplace, says she."

Straight from the brand

At a time when tablets are being churned out into the Indian

Mobile and IT, Samsung

market and brands are scrambling to be in the race, how are companies that offer hi-end models able to carve a niche of their own? "At Samsung, we launched the first Galaxy Tab in 2010 and pioneered the convergence era in India, creating a niche for ourselves in this market. It would not be out of place to say that tablets have emerged as converged

devices that have created a unique user experience, thereby revolutionising the lifestyle of the Indian consumer. We offer the widest range of tablets in terms of screen sizes ranging from 17.78 cm (7") to 25.65 cm (10.1") and across price points—from Rs 19,000 to Rs 34,000," says Ranjit Yadav, country head, Mobile and IT, Samsung.

While Samsung has managed to make a grand entry in the era of tablet computing, Sony is not far behind. "When it comes to design, it has to be Sony," feels Sachin Thapar, head, IT and the Mobile Business, Sony India.

"Sony tablets are optimally designed, and this is what sets them apart. With its uniquely asymmetric design, Sony's Tablet S is similar to a magazine that's been folded over, which makes it a wonderful experience to use for hours on end," says Thapar.

Milagrow, a home-grown brand, has launched what it claims is the slimmest tablet in India. "Innovation is our key driver to success. From being the first to launch the tablet with the most ports (a SIM card slot, a full USB, an HDMI port, a memory card slot and a 3.5 mm audio jack, all in one), to launching India's only tablet specially designed for women and rolling out the thinnest tablet—the TabTop 7.4—we have done it all," quips Rajeev Karwal, CEO, Milagrow.
