

5.6.0-RepositoryInstaller-linux.tar.gz and in a terminal, as the root, run the installer script. For me, it was extracted to `/home/rahu/ZendServer-5.6.0-RepositoryInstaller-linux`. The script needs one parameter, your PHP version, which would be either 5.2 or 5.3, so the commands could be as follows:

```
cd /home/rahu/ZendServer-5.6.0-RepositoryInstaller-linux
./install_zs.sh 5.2
yum clean all
```

You can also pass `ce` as a second argument to install the Community Edition of the server, which is free of cost, but with less features. Learn more about it on Zend's website. Installation of both is almost the same.

Now, many Linux distributions come with SELinux enabled, for better security. If you're using SELinux, set it to *Permissive* for the duration of set-up:

```
setenforce permissive
service zend-server start
```

You can also run service control commands with a Zend script, like: `/usr/local/zend/bin/zendctl.sh start`. Next, enable Zend Server to start automatically on boot:

```
chkconfig zend-server on
```

Now in your browser, navigate to `http://localhost:10081/ZendServer` or if that doesn't work, change the port number to 10082. This will open Zend Server's browser-based user interface, which will guide you through the registration wizard on the first run. Set the password and enter the licence code, if you have bought one—or, like me, get a 30-day licence key on request. As soon as registration is over, you will see the administrative interface dashboard with

information about your server, and related components and PHP development tools like the debugger, optimiser, etc.

Now, you do not want to compromise on security by leaving SELinux in permissive mode permanently; so, here are the steps to set SELinux permissions for some modules. While SELinux is still in permissive mode, in a terminal, as
