

Micheal Gove, the education secretary, has said that the changes planned are for September 2012. Terming the current curriculum as 'harmful and dull', Gove said that schools should be encouraged to integrate more content focusing on computer science, which should be beyond Excel, PowerPoint and Word.

Milagrow's TabTop for women has a special user interface

Milagrow has come out with a TabTop especially designed for women professionals, which runs on Gingerbread, the 2.3.1 version of Android. To make it appealing to women and to differentiate it from its earlier TabTop, the company has designed a special interface that depicts a woman's room, and has a pink background.

A side table lamp on the UI is meant to increase or decrease the brightness of the screen. A diary on the table signifies a notebook. A photo frame on the wall takes users to the photo gallery. Similarly, clicking the music CD on the table takes you into the music library.

Apart from this easy and attractive interface, the company claims that the women's TabTop is the lightest tablet, weighing just 275 g with a 17.8-cm resistive screen. The tablet is also preloaded with special security and anti-theft applications. For instance, there is an app that can automatically send out the location, as well as a distress e-mail or an SMS to any pre-designated e-mail ID or number, at just the press of a button. The TabTop can also be programmed to map the last location it was used in.

Besides, the latest women's TabTop comes at half the cost (Rs 13,990) of the earlier version from Milagrow.

NASA to promote open source with new website

NASA has introduced a new website, 'code.nasa.gov', to promote its open source initiatives. With this platform, NASA will showcase its open source projects, and invite public engagement. To quote from a NASA blog post, "Through this website, we will continue, unify, and expand NASA's open source activities. The site will serve to surface existing projects, provide a forum for discussing projects and processes, and guide internal and external groups in open development, releases, and contribution."

Here comes Linux 3.2!

Linus Torvalds announced the release of Linux 3.2 saying, "3.2 is out, and the merge window for 3.3 is thus officially open. I delayed 3.2 a few days, to wait for the final linux-next ('final' in the sense that that's what I'll fetch to decide whether something has been in linux-next for 3.3 or not), and then some more, as people were coming back from holidays and sorting out some regressions. So we do have a few last-minute reverts and small fixes."

Linux 3.2 brings with it an enhanced Ext4 filesystem, an optimised

Holo theme 'mandatory' for Android 4.0

Google has said that all Ice Cream Sandwich (ICS) devices will require the 'Holo' theme. Holo themes would be mandatory for Android 4.0 devices, especially if the users wish to access Google's range of apps, including the

Android Market. With this step, Google aims to attain consistency in the user interface. The Holo theme will help app developers with a standard theme, irrespective of device or manufacturer. Google has already provided for customisation by developers and manufacturers to build their own themes for the devices, like the TouchWiz and Sense.

Silk ported to rooted Android devices

The Silk browser found on the Amazon Kindle Fire has now been ported to more Android devices. A group of developers on the XDA forums share how to port Silk to a range of Android devices. Silk can be set to use Amazon's cloud-based servers to pre-load and compress popular or regularly visited websites. It results in a faster browsing experience—the reason why the browser attracts hackers. XDA member TyHi has developed a working port for the browser, which will work on a range of Android devices. A full list of compatible devices is not yet available.
