

Mozilla says this beta is special as it has done some extra work to add features, improve performance and address things that make mobile browsing faster and easier. However, as a beta version, it might still have stability issues. Users might face problems with GIF animations, full-screen Flash videos and CSS support.

The new Android version supports a wide range of Android phones from Android 4.0 all the way back to Android 2.2. Though this beta update is only available for Android phones in English, as of now, Mozilla plans to add more languages and release a new beta for tablets soon.

Spice to launch India's first 'Secure Android' handset range

Spice Mobility (S Mobility), India's leading mobile Internet company, announced that it will be coming up with India's first 'Secure Android', which offers pre-embedded security solutions to its users in its upcoming range of MI (Mobile Internet) smartphones. The initiative will reinforce S Mobility's efforts in making its devices safe and secure as users are becoming wary of the potential threat to data on their smartphones in the current scenario, as the world converges towards the mobile Internet and m-commerce.

The solutions offered by Spice will include an antivirus that will provide real-time protection from malicious Internet threats, and also offer flexibility for the user to set a schedule for regular scans of data in the device as well as SD card. Also in the security stable is a network manager, giving access to data and setting a monthly data transfer limit. Other features include anti-theft and vault-privacy locks for photos, videos, SMS, call logs and Secret Contacts.

VirtualBox 4.1 update comes with Linux 3.4 fixes

Those using Linux Kernel 3.4 can rejoice. The eighth update of the 4.1.x branch of VirtualBox has been released with compile fixes for the Linux 3.4 kernel that were recently released. The new version of the open source desktop virtualisation application, called version 4.1.16, is expected to improve the overall stability of the software by fixing various regressions. Some of these regressions could even lead to system crashes, and there is also a problem that caused some rpm-based packages to have an incorrect help file path on Linux hosts.

This new update also fixes bugs that caused VirtualBox to stop functioning when running on Mac OS X hosts with 10.8 Mountain Lion Developer Preview 2 or later. It has also removed the maximum limit of 128 networking interfaces on Linux and Mac OS X hosts, catering to the issue of a lack of limitations in case of Windows and Solaris hosts. Guest Additions for Windows and Solaris have been updated. On Windows, a driver crash has been fixed and, when 3D support is not available for Windows 8 guests, the WDDM driver is not loaded. The Solaris Additions include support for X.org Server 1.11 and 1.12.

The complete list of fixes can be found at the change log. VirtualBox 4.1.16

Max Healthcare first to receive 'Stage 6' recognition from HIMSS

Max Healthcare has become the first hospital in India and the sixth in Asia to achieve 'Stage 6' on the EMR (Electronic Medical Records) adoption model from the

HEALTHCARE

Caring for you... for life

Healthcare Information and Management Systems Society (HIMSS). This implies that a significant number of patient records are now in electronic form with minimal usage of paper charts. The hospital chain relies heavily on the use of open source health solutions.

The EHR (Electronic Health Record) implementation project that began in 2009 has now covered five hospitals (out of 12) and is hosted on the open source WorldVista EHR, an integrated clinical platform. The EHR system has been integrated (using the open source Mirth integration engine) with a home grown HIS (Hospital Information System) application and a Radiology Information System, creating an integrated environment to achieve the mission of a 'paperless' hospital.

In September 2010, Dell Services converted the information technology infrastructure of all Max Healthcare facilities into a private MPLS (Multi-Protocol Label Switching) cloud, making Max Healthcare one of the most technologically advanced healthcare chains in India. As Max Healthcare adds more hospitals to its network, the cloud deployment gives a near plug-and-play capability for information technology deployment.

As a result of these efforts, Max Healthcare received the coveted NASSCOM IT User Award in Healthcare for 2012.
