

can easily be downloaded from the project's site for Windows, Mac OS X, Linux and Solaris. An online user manual is also available.

'Free And Open' Fedora 17 officially released

The OS that is also known as the Beefy Miracle finally made its official debut recently. The Fedora project leader, Robyn Bergeron, said in a statement, "I am extremely proud of the Fedora 17 release, which is a comprehensive and robust operating system for all types of users."

There are 60 new features in Fedora 17. The desktop runs GNOME 3.4, which includes improvements like new search capabilities, improved themes and other enhancements, along with GIMP 2.8, known for its long-awaited introduction of single-window mode.

The complete list of features can be found on Fedora's project website. The software can also be downloaded for free.

Android spy software now available on Google Play!

Retina Software has announced that its cell phone spy software, ePhoneTracker, is now available in the Google Play store. The software is said to monitor every Android phone activity and send detailed reports to the owner's email account. It is also claimed to be the first real working 'mobile spy software' to be legitimately available through Google Play.

After users set up ePhoneTracker on their phones, it records activities such as text messages, call history and GPS location, and sends detailed reports to their email accounts, even if the history is deleted from the device.

The software is compatible with smartphones running the Android OS 2.1 and later.

Linux Foundation announces FOSS Bar Code Tracker

The Linux Foundation has announced a new tool to track free and open source software (FOSS) components. Called the FOSS Bar Code Tracker, it promises to simplify the way open source components are tracked and reported by using an auto-generated, custom QR code for each product. The QR code carries important information on the FOSS stack contained in a product, such as component names, version numbers, licence information and links to download the source code, among other details.

The Linux Foundation has released the tool as an open source project under the MIT licence.

With the help of the FOSS Bar Code Tracker, product development teams can easily create their own FOSS Bill of Materials, identify FOSS components included in each product, and also update and share that critical information throughout the supply chain for compliance purposes.

Is Ice Cream Sandwich doomed with the imminent arrival of Jelly Bean?

Adoption of the latest version of the Android OS, Ice Cream Sandwich (ICS), has reportedly not been as high as expected. As per the Android Developers' reports, the adoption rate at the beginning of the year was 0.4 per cent, which thankfully increased to 6.7 per cent, as of June 1, 2012. But

compared to Gingerbread, this growth is very slow. Also, Jelly Bean is around the corner, which may again disrupt Ice Cream Sandwich adoption rates.

OEMs are likely to be blamed for the delay. They first skin the OS, then test it to make sure everything is fine, before releasing it on their phones. This takes time as they have to test the OS on different versions of the same phone to be sold in different countries for different carriers. But still, we are not too far from the stage where more than 50 per cent of phones would be running the ICS upgrade.

But, with the imminent arrival of Jelly Bean, which as per rumours, is likely to debut at the end of the month, OEMs are likely to straightaway switch to Jelly Bean from Gingerbread. This, in a way, threatens the most cherished Android OS version 4.0 or ICS. The Nexus devices (from different OEMs like HTC initially, and then from Samsung) were the first to adopt Android 4.0.
