

components are being utilised for using memory efficiently, for reducing contention, for string manipulation, etc. Facebook has added the Folly library on GitHub, and the company has plans to keep updating it with new components as and when they are written.

Samsung pumps \$500K into the Linux Foundation to fight iOS

Samsung Electronics has invested \$500,000 to join the Linux Foundation at the platinum level, which is the highest tier of membership. This will allow the electronics giant to have greater oversight on the forthcoming versions of Linux. This includes the much-awaited Tizen platform as well.

This announcement strengthens Samsung's commitment to Linux and investing its resources in a platform will help the company sustain its global leadership position. The company will work with The Linux Foundation on streamlining its participation with the kernel community and adopting open source best practices.

Red Hat delivers cloud flexibility and agility to enterprises

Red Hat Inc, the world's leading provider of open source solutions, today announced the next step in its delivery of open hybrid cloud solutions to enterprises with the general availability of Red Hat CloudForms. This is an open hybrid cloud management platform built to enable enterprises to create and manage Infrastructure-as-a-Service (IaaS) hybrid clouds with the ability to make self-service computing resources available to users in a managed, governed and secure way.

CloudForms delivers the flexibility and agility businesses want with the control and governance that IT needs. Organisations can build a hybrid cloud that encompasses a wide variety of infrastructure from many vendors, thus managing their cloud applications while avoiding vendor lock-in. With CloudForms, enterprises can build and manage an open enterprise hybrid cloud, providing infrastructure choices spanning multiple virtualisation platforms and extending to public cloud resources.

Thunderbird 13 debuts with 'Filelink'

Mozilla is showering us with exciting updates and the latest one is the Thunderbird 13 with 'Filelink' as an addition. Filelink lets you send large attachments by uploading them on an online storage service and sending the link to the file instead of those bulky attachments directly to the recipient. This would help avoid the bouncing back of emails. Till now, only the YouSendIt service was available for large attachments.

Mozilla has partnered with the domain name and email management service providers Hover.com and Gandi.net to provide the users a personalised email address within the application, which will be automatically configured to send and receive messages.

Interested in learning FOSS in your own language?

IIT-Bombay is working on a project called The Spoken Tutorial, which as the name suggests, offers vocal tutorials on various Free and Open Source Software in different Indian languages. Shyama Iyer, project manager, Events - India at IIT-Bombay, said, "The objective of The Spoken Tutorial is to provide knowledge of Free and Open Source Software to the masses who do not have access to any means of learning the software. Lack of knowledge about accessibility, proper guidance, availability of infrastructure and difficulty in understanding English are the common hindrances in promoting FOSS. We have tried to deal with these issues through these tutorials."

The aim of this project is to make every Indian switch to open source software. Iyer added, "Our project is a part of the National Mission on Education through ICT, funded by the Ministry of Human Resource Development, Government of India. We're working towards our vision by training college students and faculty on software that they can use in their professional life—for example, Scilab, Python, PHP, MySQL, LaTeX and Linux. This training is also offered to corporate houses. We also offer training on Libre Office and Ubuntu to staff members of schools, colleges, government offices and companies."

IIT-Bombay also offers Faculty Development Program on LaTeX to all faculty members, thus aiming to improve educational institutions across India. It has worked on making Scilab a part of KIET (Krishna Institute of Engineering and Technology) Ghaziabad's regular curriculum for Electronics Engineering and Computer Science Engineering.

To avail any of these training programmes, all a learner needs is a computer and a basic mobile ear-phone. Learners need not leave their campus to avail the training. Spoken Tutorials reaches out to its learners through networking. This network is being spread out across the country by students and faculty who have experienced the magic of learning FOSS using the AV Instructional Methodology, i.e., 'Spoken Tutorials'. These AV tools are sent by the team in IIT-Bombay in a CD (and can also be downloaded from <http://spoken-tutorial.org>).
