

Electronic Health Record Systems An Overview

Here is a comparative study of three EHR (Electronic Health Record) systems: OpenVista, Open MRS and Open EMR.

Vista stands for the Veterans Health Information Systems and Technology Architecture. It is an open source EHR. Vista is a fully incorporated, enterprise-wide healthcare information system, which has been developed and used for the past 20 years by the Veterans Health Administration (VA), the largest centrally directed healthcare system in the US.

MRS stands for Medical Record System. Open MRS represents a collaborative effort to develop an open source EHR for developing countries in the fight against HIV/AIDS, multi-drug resistant tuberculosis, malaria and related health crises. Open MRS is a multi-institution, non-profit collaborative led by the Regenerstrief Institute, a world-

renowned leader in medical informatics research.

Open EMR (Electronic Medical Records) is open source software designed to help a medical practice manage everything from scheduling to patient records.

Features

The main features of the three EMR systems briefly outlined above are given below.

OpenVista

- *Improved patient care:* Decreased variance and automated care delivery processes enhance workflow, creating more time with patients and limiting error-causing scenarios
