

2. Go to the *Manage Module* page on the administration page and click *Add or Upgrade Module*.
3. After this, select the *.omod* module file you downloaded, and click *Upload*.
4. The module will be installed without restarting the server. Note that each time an action is taken on a module, the OpenMRS context is restarted. When a module is loaded, the database changes that it requires in Liquibase, if any, are applied to the database.

The module is now accessible to everyone privileged to use it. Modules can have granular privileges, i.e., any specific set of roles as required by the module.

Note: There are other ways of installing modules, like directly searching the OpenMRS modules repository and installing directly from the repository—or dropping the *.omod* file in the defined module repository folder.

Starting and stopping the module

Go to the OpenMRS module management page and click the red button to stop it, or the green button to start it. While doing this, no database changes made by the module are lost; only the OpenMRS context is restarted, and the module is started or stopped.

Module updates

You can check for updates to modules by clicking the *Check For Update* button on the *Manage Modules* page. You can also upload a newer version of the module through the Web interface, or directly dump the module file to the OpenMRS module repository.

On an update, first the old module is removed. After that, database changes from the previous version to the newer version (i.e., with different IDs) are applied to the database. Then the module is loaded.

Module deletion

To delete a module, in the module management page, click

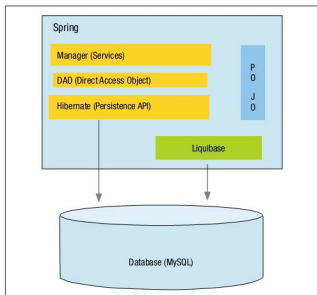

Figure 1: Typical architecture of the OpenMRS stack

the grey icon next to the module you want to delete. Any database changes done by the module are not deleted. The OpenMRS context will be restarted after removal of the module from the module repository folder. **END**
