learn the actual functioning of each module, and how each of these are inter-linked. The demo database can be installed as explained on the wiki.

After you are able to work with the software efficiently, you need to deploy it by inserting information related to your medical infrastructure, like the

details of the centres, buildings, beds, operating rooms, physicians, etc. in order to make the software actually useful. Make sure you don't do that in the demo database itself—create a new database for this purpose.

Snapshot review

Getting the hang of the software does take a little time, due to the apparent lack of good documentation. Also, the software can be very productive and beneficial to the work-flow of the health centre where it is deployed. But frankly, a good review of the software can only be done by the people who use it and for whom it is intended—the medical practitioners.

However, I believe that this is a complete software package that can handle all the digitisation needs of a medical centre—right from appointments, hospitalisation and lab reports, down to the very last process, i.e., billing. It has the potential to optimise and centralise all the medical information, and makes it much easier to share, analyse, study and collaborate on.
