Gaurav Kumar Bhardwaj:

Can someone help me remove the error while building a simple "Hello World" program in C. The error is: "Compiling: C:\Users\Gaurav Kumar\Desktop\Untitled1.c Execution of 'gcc.exe -c "C:\Users\Gaurav Kumar\Desktop\Untitled1.c" -o "C:\Users\Gaurav Kumar\Desktop\Untitled1.o"' in 'C:\Windows\system32' failed. Nothing can be done.

Jatin Khatri: What is the content of untitled1.c ?

Gaurav Kumar Bhardwaj: Content is:

```
#include<stdio.h>
int main()
{
    printf("Hello World!!");
    return 0;
}
```

Nick Bishop: Download Code::Blocks, that will just do it!! :) <http://www.codeblocks.org/>. Remember, you should better name your source code files without gaps (spaces) in their names, and store them in folders whose names have no gaps (spaces) too. e.g. C:\Users\Gaurav_Kumar\Desktop\Folder_1\Folder_2\My_Source_File.c

Gaurav Kumar Bhardwaj: I tried the same but it still showed error: Compiling: D:\Untitled2.c Execution of 'gcc.exe -c D:\Untitled2.c -o D:\Untitled2.o' in 'C:\ProgramData\Microsoft\Windows\Start Menu\Programs\CodeBlocks' failed I'm using Cygwin compiler and its settings are same as written in the Codeblocks official site. I'm using Windows 7. Environment variable's Path has been set for Cygwin.

Nick Bishop: Why don't you check this out? <http://cygwin.com/cygwin-ug-net/programming.html> By the way, I was wrong earlier. When you want to browse Windows folders using the command line, you should not use /, this is for web browsing, you should use \. e.g. C:\NickBishop\Folder\File.c

Sanjay Maddala:

How to configure dhcp server in Linux 6.1? Please give the steps.

Like · comment

Raghu Ramu: Here are the required steps:

```
#yum install dhcp*
#setup
#service network restart
#chkconfig network on
Copy DHCP Conf File into /etc Directory:
... #cp /usr/share/doc/dhcp*/dhcpd.conf.sample /etc/dhcpd.conf
#vim /etc/dhcpd.conf
line no 7: domain-name "give ur domain name"
line no 8: domain-name-server give ur host name
line no 18: remove # symbol
line no 27: subnet 192.168.20.0(give ursubnet id)
netmask 255.255.255.0
line no 32: subnet 192.168.20.0(give ursubnet id)
netmask 255.255.255.0
line no 33: range 192.168.20.1 192.168.20.200(this is ip range)
option routers 192.168.20.200(this s router id)
:wq(save and quit)
#service dhcpd restart
#chkconfig dhcpd on
#arp
FIXED IP:::
#vim /etc/dhcpd.conf
line no 75:
host desktop1(domainname){
    hardware ethernet 70:71:bc:e8:35:5d;(this for hardware address)
    fixed address 192.168.20.70 (this fixed ip address )
}
#service dhcpd restart
#chkconfig dhcpd on
```

Sanjay Maddala: Thanks Raghu!

Thiya Rajan: This link might be more useful for you, <http://www.updatedlinux.com/step-by-step-installing-a-dhcp-server-under-linux/>

Anbarasan N India:

I need some advice on how to get the Oxford Advanced Learner's Dictionary for Linux Fedora 16?

Like · comment

Thiya Rajan: Try #yum install stardict. It has a translator as well (powered by Google).

Anbarasan N India:

I need to install Oxford Advanced Learner's Dictionary. It could be installed on Windows but not on Linux. Is there any software to combine Linux and Windows' third party softwares like Oxford Dictionary?

Raghu Ramu: Use Wine software to support .exe format. This would help!
