Gvs Chaitanya:

Can anybody please post the link to download Perl in Ubuntu 10.10?

Like · comment

Phani Kumar Veluturi: It's "apt-get install perl"

Gvs Chaitanya: Thanks! Can I also get the link for downloading the VLC Player in Ubuntu?

Phani Kumar Veluturi: This would be "sudo apt-get update sudo apt-get install vlc vlc-plugin-pulse mozilla-plugin-vc". If it's not working run these commands, "sudo add-apt-repository ppa:lucid-bleed/ppa", "sudo apt-get update", "sudo apt-get install vlc vlc-plugin-pulse mozilla-plugin-vc".

Gvs Chaitanya: Thanks again!

Sutanu Das:

Please help me create a repository server and DNS server on Red Hat Enterprise Linux 6.

Like · comment

Kamal Aswani: First, for creating a private repository:

Package required:
1)createrepo-0.9.8-4.el6.noarch (install it)
Make a directory inside /var/www/html,...say rhel6
... Copy all the packages i.e the Packages directory from the DVD to /var/www/html/rhel6/Packages
run the command
createrepo /var/www/html/rhel6
change ur directory to /etc/yum.repos.d
create a file with dot repo extension
say vi das.repo (using vi to create this file) enter the lines below
[Das]
name=Das
baseurl=http://localhost/rhel6
gpgcheck=0
enabled=1
run ur apache server using "service httpd start"
now use "yum repolist all" (it will display u all the repositories)

Second, to create a master DNS server do the following:

Packages required:
bind-utils-9.7.0-5.P2.el6.i686
bind-9.7.0-5.P2.el6.i686 (this is the primary package)
bind-libs-9.7.0-5.P2.el6.i686

...
Edit the file called "named.conf" inside /etc
i.e vi /etc/named.conf
create a zone in this file:
Example:
zone "das.com" IN {
type master;
file "das.com.zone";
allow-update { none; };
allow-query { all; };
};
create a file called "das.com.zone" inside /var/named
i.e by
cd /var/named
vi das.com.zone
\$TTL 1D
@ IN SOA das.com. das.gmail.com. (
0 ; serial
1D ; refresh
1H ; retry
1W ; expire
3H) ; minimum
das.com. IN NS ns1.bigrock.com.
das.com. IN A 192.168.1.44

Hithu Anand:

I got the PCLinuxOS, Mageia and Linux Mint with the magazine. However, since I am new to Linux, hence thought of installing Ubuntu (which I don't have) first. Which is the best FOSS OS for dual booting?

Like · comment

Nick Bishop: It depends on what you want!! If you prefer a stable OS without many bugs, try Ubuntu 10.04.4 or Debian or Slackware!! If you are new to Linux and you want a very user friendly distribution, try Zorin or Pinguy or Mepis or PCLinuxOS!

Hithu Anand: PCLinuxOS is the last option? I have installed it and it's very user friendly. Though I didn't experience any bugs yet since am new. I have found the online community of the OS to be very helpful.

Mohit Rajput:

Can we use Windows and Linux both on a single computer? If yes then how?

Like · comment

Pranav V P Thekkoot: Yes, you can! Just install both of them in different partitions.

Ashwin Jil: First install Windows on your system, then insert the Linux CD, go ahead with the installation from "boot from cd". Install the Linux in separate partition for example if you have done Windows in C:\ means, install Linux in D: or something else. Finish the installation, that's it!

Mohit Rajput: Thanks!
