

The Tizen 1.0 Larkspur OS SDK and source code released!

The Tizen team has announced the release of the Tizen 1.0

Larkspur OS SDK and source code. This release has come after the leak of Tizen OS

pictures last year. It comes with some complimentary components, which include an IDE with flexible debug tools, a simulator and an emulator.

A simulator provides browser-based support to Tizen APIs, while an emulator improves the performance through Intel's Hardware Acceleration Manager for Windows and OpenGL acceleration for Linux.

The update comes with support for W3C/HTML5 specification features, Point of Interest (POI) and the route-search facility. It also has Wi-Fi Direct key features incorporated in it. The Tizen team has added a few changes in the community infrastructure to generate developers' interest in this platform. Such changes include the addition of a bug tracker and wikis, with the promise of more features in the frequent updates from now onwards.

Facebook infringing 16 patents with open source: Yahoo!

In its latest attack on Facebook, Yahoo! has warned the social network giant that it may be violating 16 open source patent technologies that are being used in Facebook data centres and servers. Reportedly, Facebook has been repeatedly changing its initial public offering (IPO) filing keeping in mind the supposed legal threat from Yahoo! And now the social network giant updated it for the fifth time before releasing its IPO prospectus.

Facebook's release reads: "Yahoo! could in the future assert additional patent or other claims against us in this or in other proceedings. For example, we received a letter dated 23 April, 2012 from Yahoo! indicating that they believe 16 patents they claim to hold "may be relevant" to open source technology they allege is being used in our data centres and servers. Yahoo has not threatened or initiated litigation with respect to matters described in this letter but it may do so in the future."

Sensory brings voice activation to Samsung Galaxy

The new Galaxy S III that was recently unveiled by Samsung is the latest Galaxy device to incorporate Sensory's TrulyHandsfree technology, following the Galaxy S II and Galaxy Note. Sensory's TrulyHandsfree enables users of these Samsung devices to activate and access their device with the voice trigger phrase "Hi Galaxy." Through voice activation, users have the ability

Microsoft's open source subsidiary starts delivering

Here comes the first deliverable from Microsoft's open source subsidiary called Redis On Windows.

The company has announced the release of an updated version of Redis on Windows. Redis, a VMware sponsored project, is an open source, in-memory, networked, key-value data store with optional durability. Redis is written on ANSI C. According to a blog post written by Claudio Caldato, principal program manager for Microsoft Open Technologies, this is a 'a new and significant iteration' of Redis on Windows.

Caldato said, "The major improvements in this latest version involve the process of saving data on disk. Redis on Linux uses an OS feature called *Fork/Copy On Write*. This feature is not available on Windows, so we had to find a way to be able to mimic the same behaviour without completely changing the save-on-disk process, so as to avoid any future integration issues with the Redis code."

This updated version of Redis on Windows utilises the Copy On Write process at the application level. It means that Microsoft has added code to Redis, which enables some data structures to get duplicated in a way that Redis is able to serve clients' requests and simultaneously save data on disk. This helps in achieving the same effect as that of *Fork/Copy On Write* on Linux.
