

mSecure Password Manager: You can use this to safely store passwords and private information. This app safeguards website logins, bank accounts and credit cards, protecting your reputation, identity and finances.
Price: Rs 529 approximately
Link: <http://bit.ly/LOIXtY>

OpenOffice Document Reader: Android's first OpenOffice/LibreOffice Document Reader. View your documents on the go. It's simple, fast, light-weight and well integrated.
Price: Free
Link: <http://bit.ly/JoCIT7>

RealCalc Plus: Here's a full-featured scientific calculator. Its key features include traditional algebraic or RPN operations, fraction calculations and conversion to/from decimals, degrees/minutes/seconds calculations and conversion, result history, etc.
Price: Rs 170 approximately
Link: <http://bit.ly/IrJoZu>

Scientific Calculator: If you have limited use for such a device and want a free scientific calculator with only a few

features, this app is for you. Besides basic calculations, you can do trigonometric, logarithmic and factorial operations.
Price: Free
Link: <http://bit.ly/J3AEer>

Smooth Calendar: There are many calendar applications in Google Play, but I find the simple Smooth Calendar widget easy to use when compared to the design and UIs of other apps. It also is in sync with Google Calendar, Exchange and Facebook.
Price: Free

The author is a FOSS advocate and loves to learn new technologies. His areas of interest include Kinect, Linux, Arduino and Image Processing using OpenCV. In his spare time he writes motivational thoughts and shares the good ones on his blog <http://shahsamarth.wordpress.com/>. He can be reached at shah.samarth.p@gmail.com.

(Continued from Page 20....)

- However, this doesn't mean that your phone won't be unlocked if it fails to recognise you—there is a fall-back option available.
- One of the drawbacks of this feature is that it does not work properly in the dark (outdoors as well as indoors) due to the lack of a backlight.
- Also, it's easy to crack. Someone can use your photograph to unlock your phone.

Applications/widgets

- The applications menu has a nice look and feel. It allows you to view all recently visited applications as a list of thumbnails of the apps.
- A new and better-looking GTalk messenger is another highlight. Though the application is a bit heavy, who cares—we have a 1.2 GHz dual-core device.
- The e-mail client is a bit heavier and slow. The previous e-mail client was a clear winner in this regard.
- Once you start browsing the applications, you may find some new icons in the applications menu, like Google+ and Messenger.
- You can have Live Application widgets on your home screen. You can add your mail box, Facebook, and even play music, right from your home screen.

Wi-Fi

Now this is a big disappointment. The handset takes a long

time to scan and enable Wi-Fi on the phone.

Data usage

- The new ICS allows you to view the data flow from your handset as graphical reports. It comes in handy if you are on a limited data plan. You can select different cycles to view data usage.
- It also provides an option to toggle between cellular and Wi-Fi data usage, which is a welcome feature.
- You can also find out which apps are using the maximum data transfer.

Kies Air

The upgrade lets you 'Sync with Simplicity' and eases phone-to-phone data transfer. For example, you start the Kies Server on Device A and open Kies on Device B. You shake the device twice, and it will identify Device A and initiate the data transfer.

These are the broad features of the new ICS. I will be experimenting with the device further, so stay tuned...
