Figure 3: Adding effects

audio and video effects that you can add to your existing media. Next are the three monitor panes —*Clip Monitor*, *Project Monitor* and *Record Monitor*. The first shows or plays the currently selected clip from the time-line or project tree. The *Project Monitor* pane plays the entire project video made so far. The *Record Monitor* pane comes into the picture only when you hook up your HDV/DV camera and want to see the clips stored on it.

## The time-line

The time-line shows the content of your project on a time scale, so you can add or remove different media at a particular instant, during the project. Once you import all your audio/video clips or images to the project tree, you then have to drag them to the relevant point in the time-

line. The time-line has pre-defined audio and video tracks; hence, your media has to be put into the appropriate track. You can add more audio/video tracks using **Project > Tracks > Insert Track**.

## Cutting a clip

For a clip on the time-line, you can preview it in the *Clip Monitor* pane, and cut it (to remove or relocate part of it in the time-line, perhaps). Select the clip in the time-line. You will see a position tracker arrow above it. Drag that arrow to the point from where you want to start cutting the clip, then press **Shift + R** on your keyboard. Now move the position tracker to the point where you want to end cutting the clip, and again press **Shift + R**. Now you will see that the selected portion of the clip is separated from the rest of the clip. Remove it, or drag it to a new location. In Figure 2, you can see that I have cut a video tutorial that I made on Ubuntu into different parts in the time-line.

## Adding effects

Now this is very interesting. Once you have added media clips to the time-line, you can add some effects. Right-click your media clip on the time-line and choose **Options**. You will see a lot of different effects, in categories. I won't explain each—apply an effect to check its result, or visit <http://bit.ly/JOYN0n> for a list of effects with the resultant images. You can see in Figure 3 that I have converted my Ubuntu video tutorial to black and white, using the grey-scale effect.

## Splitting audio from video

There may be a time when you want to remove the audio from a video clip, or maybe add your own audio to it. This is easily done. Right-click the video clip in the time-line and choose the **Split Audio** option. You will see that your video clip has been split into two parts—one in the video section, with the video only; and a new clip in the audio section below, containing only the audio. Now, again right-click that group, and select **Ungroup Clips** to separate the audio and video portions of the clip. Delete the audio portion if you don't want it. You can now add
