DoCoMo wants changes in Android to avoid disruptions

NTT DoCoMo wants Google to modify its Android operating system to ensure that smart-phones running on the OS generate less data traffic. DoCoMo has identified an Android application as the cause behind a service disruption that occurred recently. This 'identified' Android app is used for free-of-charge voice communication.

There are several Android applications that send out control signals once every three to five minutes, even if they are not being used. The data traffic generated in such cases is up to 10 times more than conventional mobile phones. This kind of 'unnecessary' data traffic puts an additional strain on the network.

Keeping in mind the fact that wireless operators are already struggling with clogged telecom networks to meet the growing demand for data services on-the-go, this kind of data consumption puts additional pressure on them to speed up investments in capacity building. Android devices transmit control signals every 28 minutes automatically. DoCoMo has said that Google should make the transmission of control signals less frequent, as such service disruptions would affect the popularity of Android devices as well.

Android India offers specific app suggestions

Recently, a new application called Android.co.rs that provides localised results for all major states in India, has been developed by an independent developer. This application acts as a suggestion engine; it provides customised

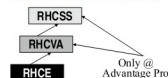

suggestions regarding local apps for areas like Bengaluru, Chennai, Delhi, Gujarat, Hyderabad, Kashmir, Kerala, Kolkata, Mumbai and Tamil Nadu. This means that a user in these cities can easily browse through the catalogue of applications that have been specifically made for those cities/regions.

In addition to this, the application also provides app suggestions for other regions that are not part of a dedicated group and are listed under other Indian regions.

Android India is offering 1,628 applications grouped under various states and regions of India. These apps can also be accessed under the India tab in the application. It also offers a choice of recommended international applications from a catalogue of 720 apps, which were made available with
