

# Knowledge Management Using OpenKM

Document management is an immensely complex task for organisations, where several people work on multiple documents, each of which probably has more than one version. How long can one depend on memory for file locations, names, and the changes made? OpenKM is an open source tool that lets you manage your documents online. You can version your documents, manage users, share select documents with select users, and much more.

**Y**ou can download the latest OpenKM build as a zip file from the official site. It bundles the JBoss server required for OpenKM to run, so you don't need to set up a separate Web server. Make sure you have JDK 1.6 or above installed on your system, since the JBoss server needs it. Once downloaded and extracted, start it and then run the *run.sh* (Linux) script in the *bin* folder, in a terminal window.

Any errors or warnings are visible in this terminal window. With the JBoss server started, you can access OpenKM at <http://localhost:8080/OpenKM/>.

By default, JBoss only listens for connections on *localhost*. To make it available to other computers on the network, run *run.sh* with the parameter *-b 0.0.0.0*. Access OpenKM from another PC on the network by replacing

*localhost* with the IP address of the 'server' in the URL.

## Profiles and users

The default login ID and password are *okmAdmin* and *admin* respectively. This takes you to the home page, from where you can now upload files to share them. However, that is not much use without other users. Since you're logged in as an admin, you can first create profiles
