for the Roomba iCreate (Figure 11), <http://code.google.com/p/aptima-ros-pkg/>.

Voila... the robots!

Willow Garage introduced ROS into robots designed by their own selves. PR2, the Turtlebot, some of their early releases in Box Turtle and C Turtle had PR2 in the default setting. However, now a host of robots have been using ROS. Academics, entrepreneurs, hobbyists and the industry often come up with their own ROS package for simulation and the controls of that particular robot.

The Turtlebot and Billibot use the Microsoft Kinect, and ROS partially supports the ASUS Xtion. ROS has also developed a package for Android, such that robots can be controlled using only the mobile phone.

Here is a not very comprehensive list of robots using ROS: PR2, Turtlebot, Corobot, Roomba, Care-O-Bot, LEGO Mindstorms, AscTec Pelican/Hummingbird, Shadow Robot and Billibot.

MORSE, YARP, MOOS, ARGoS, etc

Many other platforms and middleware have been developed. ROS has been used in tandem with YARP

Figure 12: Roomba iCreate in gazebo

Figure 14: Turtlebot and the Billibot

and MORSE. ARGoS and Swarmanoid are two wonderful software for swarm robotics.

Watch this space for more information on similar platforms and software. **END** 🐼
