Terms & Conditions: * These rates are applicable for new subscribers as well as renewal of existing subscribers. ** The rates are valid for subscribers within India only. # Please allow 4-6 weeks for processing of your subscription. @ Disputes, if any, are subject to exclusive jurisdiction of competent courts and forums in Delhi/New Delhi only.

concatenation. Now that we have a table and a few rows of data, let's look at some SELECT, UPDATE and DELETE queries. To select rows with the value for 'city' as 'bangalore', use the following query:

```
SELECT * from kv_data where data->'city' = 'bangalore'
```

To get the average age across the table (returns 27.0), use the query given below:

```
SELECT avg((data->'age')::integer) age from kv_data;
```

Here, `::integer` is used to type-cast the text value to an integer, so that math operations can be performed on it.

To select and sort rows by 'name' values, use:

```
SELECT * from kv_data order by data->'name' desc
```

Update the 'city' value to 'delhi' for all rows, as follows:

```
UPDATE kv_data SET data = data || ('city' => 'delhi');
```

Then, delete the 'age' key (and values) from all rows, as shown below:

```
UPDATE kv_data set data = delete(data, 'age')
```

Next, delete rows with the 'name' as 'amit':

```
DELETE from kv_data where data->'name' = 'amit'
```

Although not a full-fledged key-value storage, *hstore* does provide us with the flexibility of a key-value database and the power of SQL queries.

Other useful modules

Here are some other modules you may find useful:

- *Pgcrypto* provides functions for hashing and encryption. It supports SHA, MD5, Blowfish, AES and other algorithms.
- *Citext* adds a case-insensitive text data type, which stores text in lower-case form.
- *Uuid-oss* provides functions to generate universally unique identifiers.
- *Pg_trgm* adds functions to find text similarity based on trigram matching.
