

Now, measure your blood pressure and ECG with Swasthya Slate!

Imagine a tablet that can monitor your ECG and measure your heart rate, besides various other medical functions. This idea has been turned into reality by Kanav Kahol, a US-educated Indian biomedical engineer.

Swasthya Slate (Health Tablet), created by Kahol, is being dubbed as a first-of-its kind diagnostic tool. The tablet can record body temperature, conduct an ECG test, test blood sugar levels and blood

pressure, measure your heart rate and also test the quality of water.

Software verification and validation has shown that the readings recorded on the tablet are 99.94 per cent accurate. The information can also be stored on a local file, which can be uploaded onto a server. A 'demographics system' has also been developed to store the patient's details.

The Swasthya Slate can capture ECG data at 1,000 Hz and is capable of providing enough information to make clinical judgements.

An interface between the device and blood pressure/ blood sugar machines is also under development. Kahol is also mulling over incorporating diabetes and cardiovascular screening software. The Swasthya Slate is likely to be ready for launch in the next three months.

Munich: Switch to Linux will be cheaper than Windows

As part of the LiMux project, the city council of Munich is migrating its software systems, including 14,000 personal computers and laptops of public employees, to free and open source software. The project is aimed at completing the city council's order to run open source software on the administration's desktops in the future.

The LiMux project, recently extended until 2013, will now cost the council 50 per cent more than the earlier allocated budget. However, the migration will still cost the city of Munich about a quarter less than a comparable Windows installation, Lord Mayor Christian Ude (SPD) said while answering a question by the CSU party on the current cost of introducing LiMux. "The LiMux project's current cost to the budget is €11.7 million," Ude added.

The last 2,500 of Munich city council's 12,000 PCs should be converted to LiMux by 2012-end.

Red Hat donates \$100,000 to the future of open source

After reporting its first billion-dollar-plus year of revenues, Red Hat is now making a \$100,000 donation to the future of open source.

The company recently reported fiscal 2012 revenue of \$1.13 billion and fourth-quarter revenue of \$297 million, up 25 and 21 per cent year-over-year respectively. "Red Hat has become the first pure-play open source company and one of a few select software companies to have ever achieved this [\$1 billion] milestone," Jim Whitehurst, president and CEO of the Linux specialist firm said.

In a post on Red Hat's opensource.com community site, he said: "This billion dollar milestone is not only a win for Red Hat—it is a victory for open source advocates everywhere. Our fight has always been about something greater than just access to software code. The open source movement is rooted in shared values about knowledge; it is founded on ideas that are both ordinary and revolutionary. As members of this community, we elevate transparency over secrecy. We prize freedom rather than control. This is the open source way: sharing ideas and information, contributing to an intellectual commons that leads to greater innovation and benefits us all."

He added, "Last December, Red Hat decided that no billion dollar milestone would be complete without honouring the open source community."

The donation will be split between four projects, nominated and voted by Red Hat associates: Creative Commons (CC), the Electronic Frontier Foundation (EFF), the Software Freedom Law Center (SFLC) and UNICEF Innovation Labs.
