

'PROCESSING' HELPS NEWBIES JUMP-START ANDROID APP DEVELOPMENT

If you have not yet dabbled in the Android app development world, do not worry. Read all about 'Processing', a mature programming language and IDE that helps non-coders get started on programming!

It was 1995 and the Web was still young. Back then, HTML was what you just had to know, if you were a good techie. When people asked if you knew how to build a simple, plain-Jane static website and you said that you could, their expressions would change to awe and wonder. Since then, we have had the big dotcom boom (and bust), Web technologies have matured, and we have now come to shape the way we connect, develop and share. Something similar has happened in the mobile app domain recently (and hopefully, this will not be followed by a bust). Even though Symbian and its aging brothers still have their share of apps, unfortunately, these are very primitive and not as advanced as the plethora of apps on today's smartphones. So if you know how to build apps, you're sure to be in (a lot of) demand!

Even if you haven't dabbled in the app development world yet, don't worry — that's what this article is going to

help you do! 'Processing' is a simple, easy-to-learn API built on top of Java. Traditionally used by interaction designers to create all sorts of cool applications, to interface with webcams, Arduinos and what not, Processing is now a mature framework that makes it a great candidate for our purposes. Read on to find out how to take this into our smart devices and out into the marketplace.

About Processing

The brainchild of Casey Reas and Benjamin Fry, Processing is an open source programming language and IDE (Integrated Development Environment). Its objective is to help non-coders get started with programming—creating code that seamlessly generates visual feedback. In other words, Processing is used to generate visuals, whether it's abstract art, geometric shapes or even 3D models. To see all the cool stuff Processing allows
