

Figure 1: EasyGUI application in action

except Tkinter, which comes with Python on Windows, so EasyGUI works out of the box—but you have to install Tkinter on GNU/Linux since most distributions don't have it installed by default. In Ubuntu, a simple `sudo apt-get install python-tk` will all you need.

To get a feel of EasyGUI, download the tarball (the link is given in *References*), unzip it, `cd` to the extracted directory, and run `python easygui.py`. The application (Figure 1) presents a listing for different dialog boxes; click to try them out, one by one. The dialog boxes are modal; only one kind is active at a time. As you can see, EasyGUI can create the GUI dialog boxes listed in Table 1.

Table 1: EasyGUI dialog boxes

<i>boolbox</i>	Presents the choice of 'Yes' or 'No'
<i>buttonbox</i>	Dialogue box to show programmer-defined buttons
<i>buttonbox with an image</i>	Adds the specified image to the box
<i>ccbox</i>	The <i>Continue</i> or <i>Cancel</i> dialogue box
<i>choicebox</i>	Select one of the choices shown
<i>codebox</i>	Display formatted text with space in a mono-space font
<i>diropenbox</i>	Directory path selection dialogue box
<i>enterbox</i>	Text entry dialogue box
<i>enterbox with an image</i>	Adds an image display
<i>exceptionbox</i>	Shows details of the most recent exception
<i>fileopenbox, filesavebox</i>	File Open/Save dialogue boxes
<i>indexbox</i>	<i>Buttonbox</i> dialogue box that returns the index of the button clicked
<i>integerbox</i>	Accepts an integer between specified upper and lower bounds
<i>msgbox</i>	Shows the specified message
<i>multichoicebox</i>	Selects one of multiple options
<i>multiterbox</i>	Multiple text entry dialogue box

Figure 2: Some EasyGUI dialog boxes

<i>multipasswordbox</i>	Same as the previous row, but the last field is a password entry
<i>passwordbox</i>	Accepts 'hidden' text (password entry)
<i>textbox</i>	Shows text with proportional font and line wrapping at word breaks
<i>ynbox</i>	Dialogue box to select from 'Yes' or 'No'

Most of these dialog boxes don't show a title by default, but you can pass a title string as the second parameter or via the `title = <dialog title>` named parameter to the respective function. You can pass the text to show in dialogue boxes as the first parameter, or as `msg = <dialog message>`. The EasyGUI dialogue boxes return either `None` or an empty string if the user clicks *Cancel* in the dialogue box (wherever it's present). You can take appropriate decisions in your script based on these return values.

Now, it's time for some working examples. Run *greeter.py*, shown below, with `python greeter.py` in a text console. Enter any password except *fossrulz!!!* or any OS with win in its name, and see how it behaves. You will also notice that the *integerbox* will not accept values that are not between its lower and upper bounds. Figure 2 shows some of the dialogue boxes created by this example:

```
#! /usr/bin/env python

# import all the classes and functions from EasyGUI.
from easygui import *

def main():
    msg1 = 'The greeter needs OS name and password, do you know both?'
    if 1 == ynbox(msg1, 'EasyGUI Ynbox'):
        msg2 = 'Enter the info:'
        flds = ('OS name', 'Password')
        vals = multipasswordbox(title = 'EasyGUI Multipasswordbox',
                                msg2, flds)
        if -1 != vals[0].lower().find('win') or 'fossrulz!!!' !=
            vals[1]:
            err1 = 'Either your OS is not supported or password
            is bad, Bye!'
            msgbox(err1, 'EasyGUI Msgbox')
```
