

Virtualisation and Its Evolution

Though virtualisation gained popularity only in the twenty-first century, the concept had taken root as far back as the 1960s. Today, the era of cloud computing is taking it to the next stage of evolution!

Early on, IT administrators began to realise that conventional methods of handling IT environments were no longer effective because of the rapid changes in requirements in agile business environments. The demand for the faster time-to-market for applications, the installation or upgrade requests, the need to quickly apply security

patches to operating systems and applications, and many other management complications led to a new strategy for server handling and management.

IT organisations need a more nimble strategy to manage environments that easily adapt to rapidly changing needs, where new functions can be deployed in days rather
