

```
[domain/LDAP]
auth_provider = ldap
id_provider = ldap
chpass_provider = ldap
ldap_uri = ldap://your.ldapserver.com
ldap_search_base = dc=example,dc=com
cache_credentials = true
ldap_tls_cacertdir = /etc/openldap/cacerts
ldap_tls_cacert = /etc/openldap/cacerts/cacert.asc
```

Case 3: Network accounts with LDAP and Kerberos back-end

This is a case where your identity provider is LDAP, and you want to authenticate against a Kerberos domain controller. SSSD does not have a Kerberos ID provider; hence, it has to be paired with LDAP to function properly. It assumes that your Kerberos server also runs a password-changing service; however, in some production cases, the password-changing services may run on a different server, and at times on a non-default port. So it is best that you specify the directive `krb5_kpasswd`, which uses the KDC by default.

Here's a sample configuration of `sssd.conf` for the LDAP and Kerberos back-end:

```
[sssd]
config_file_version = 2
services = nss, pam
domains = ldapkrb5

[nss]
filter_groups = root
filter_users = root
reconnection_retries = 3

[pam]
reconnection_retries = 3

[domain/ldapkrb5]
cache_credentials = true
id_provider = ldap
```

```
ldap_uri = ldap://your.ldapserver.com
ldap_search_base = dc=example,dc=com
chpass_provider = krb5
auth_provider = krb5
krb5_server = kerberos_server
krb5_realm = EXAMPLE.COM
```

You may also define `ldap_user_search_base` and `ldap_group_search_base` and many more domain parameters, as defined in the manual page of `sssd-krb5`.

Enabling SSSD

Once you have configured `sssd.conf`, enabling SSSD can be managed by using the `authconfig` utility:

```
# /usr/sbin/authconfig --enablemkhomedir --enablesssd
--enablesssdauth --updateall
```

Contributions to the SSSD project, in terms of development and/or testing, are always welcome.
