**Akash Chauhan:**

I run Ubuntu 11.4 in the virtualbox, which has a disk space(fixed) of 20 GB and is full. Is it possible to expand it?

**Aman Singh:** There is an option to change that at the time of installation.

**Akash Chauhan:** Thanks, but I want to know what has to be done after installation?

**Manik Jindal:** Take a HDD and copy your data from the virtual machine on to the HDD and then, remove that machine and add a new one with a larger disc space.

**Akash Chauhan:** It is not showing even HDD and pen drive, not even a space to add additional VBox tools.

**Manik Jindal:** Before connecting your machine, connect your USB device and then after that open VBOX, usme kisi tab ke under to option aata hai to show USB drives after booting the machine. I do not remember now, but there is a way to connect them. Search on the internet.

**Manik Jindal:** This might help. Try this link <http://www.howtogeek.com/howto/31726/mount-usb-devices-in-virtualbox-with-ubuntu/>

**Shekhar Singh:** It depends on how you created your VB Ubuntu Image. It asks for the size to be variable or fixed.

**Abhilash Thekken Thottathil:** Thanks, but will this help?

**Anoop Manoj:** This is pretty straight forward, what specifically are you looking to configure?

What is Kernel programming? What language should I learn to write code?

Like · comment

**Balaji Sathyanarayanan:** Mostly "kernel" means heart of the operating system. They deal about all types of operating system functions like Memory Management, Process Management, giving the highest priority to some of the hardware functions by sending a signals etc. So to learn Kernel programming means learn C-language. And make sure one thing, learn the Linux commands.
