

Microsoft brings the SkyDrive cloud app to Android

After updating Nokia Belle phones with Microsoft's cloud service, SkyDrive, the company is now eyeing other smartphones and it has released an app for SkyDrive on Android, considering the gigantic share of Google's mobile OS. Android users can store multimedia files on the cloud-based SkyDrive app and access them from virtually any device, while also sharing them on the go.

Users can access SkyDrive content, including files shared with them, and will be able to view recently used documents, as well as choose multiple photos or videos to upload from the phone. SkyDrive also offers users the ability to share files and photos through email or a link in another app, and open SkyDrive files in other Android apps and manage, edit or delete folders.

The SkyDrive application for Windows desktop and OS X recently got updated and will now feature a new, modern design for desktop and tablet browsers, along with instant search, a contextual toolbar, thumbnail multi-select, drag-and-drop organisation and content sorting.

A Microsoft blog post made the following announcement, "As many of you know, Windows Phone users can have all the photos they take on their phones automatically sent to the SkyDrive camera roll folder. I have 1,411 photos in this folder, and it used to be a pain to get to the most recent photo. We now default to sorting by newest to oldest, which should make viewing your camera roll much better."

Java Enterprise Edition 7 will not feature the cloud

Oracle engineer Linda DeMichiel has confirmed that Java Enterprise Edition (Java EE) version 7 will not have standardisation for Platform-as-a-Service (PaaS) and multi-tenancy support until Java EE 8 comes out, which is expected by the spring of 2015.

Java EE 7 is already running late as it was previously expected to come out by the fourth quarter of this year. It has now been delayed to the spring of 2013 in order to permit the inclusion of new features, such as Web Sockets and JSONP (JSON with padding).

Java EE 6 was launched way back in December 2009 and it brought in "a division between Web and full profiles. The Web profile version, a slimmed down version of the full profile, included only features typically used in Java Web applications. Thirteen application servers are currently

Test water quality with an Android app

While we use various purifiers to ensure the water we consume is as safe as possible, many of these solutions come at a high cost and with a lot of inconvenience.

Well, John Feighery used to work for NASA, providing safe water to people in space. After the Columbia Space Shuttle accident in 2003 in which seven crew members died, he began focusing on water and sanitation issues for those on earth.

In an exclusive interview, Feighery told AlertNet, "I'd been working on supplying clean water to three or four people in space, and meanwhile there are a billion here on earth that don't have it. The world that my kids are going to grow up in has this huge problem that I felt I could work on."

Feighery realised that the need for heavy equipment, charting notes and mapping locations by hand and transporting samples in incubators to a distant laboratory needed to be simplified and made less expensive. This led to the idea of using inexpensive testing equipment available online, along with mWater, which is an Android app that records the data results of water quality tests and maps them.

This Android app is available in the Google Play store and allows people to track water quality tests at any given water source over time, thus, offering instant results. This app lets users to leave notes for other users about the appearance of the water, its smell and how it is flowing from the source, building up an archive of information over time.
