this nifty tool hasn't made it to the extension website either. Git users can use the following command:

```
git clone git://github.com/Keruspe/gPaste.git,
```

...while for PPA, add the `ppa:webupd8team/gnome3` repository just like you did for the weather earlier—update it, and then `sudo apt-get install gnome-shell-extensions-gpaste`.

The media player extension: Ever since Ubuntu integrated the music player in the GNOME panel, everyone seems to be jumping to do it too. The media player extension lets you enjoy your music collection right from the GNOME panel (you need a compatible GTK-based media player installed for this to work). The extension is available from the GNOME extensions website (<https://extensions.gnome.org/extension/55/media-player-indicator/>). For Git: `git clone git://github.com/eonpatapon/gnome-shell-extensions-mediaplayer.git`, and the `webupd8team/gnome3` PPA (`sudo apt-get install gnome-shell-extensions-mediaplayer`).

Docks: Deprecated APIs and a new Clutter desktop took away all the bells and whistles GNOME 2 used to offer, including docks. However, there is a gimmicky dock for dock fans. The let-down: the dock mimics the favourite apps panel in the activity pane, and doesn't allow any of its own effects and options. You can't even add custom entries—and in case you want to, you have to first add the application to the dock in the activities pane, and then it will automatically display shortcuts or icons on the desktop. Get it from the GNOME extension website (<https://extensions.gnome.org/extension/17/dock/>), PPA (`webupd8team/gnome3`) and `sudo apt-get install gnome-shell-extensions-dock`.

Mounters: These are handy extensions that let you see mounted devices – you can unmount them or open a file manager for one. Extension page: <https://extensions.gnome.org/extension/71/removable-drive-menu/>.

<https://extensions.gnome.org/extension/71/removable-drive-menu/>.

Sensors - CPU temperature: Paranoid about your CPU's temperature? An extension that uses the fickle `lm_sensors` does the job, if your CPU/APU is supported. Extension page: <https://extensions.gnome.org/extension/82/cpu-temperature-indicator/>.

Advanced volume mixer: Tired of the flimsy PulseAudio, yet want more control over your music playback and pipelines? The advanced volume mixer will be just right for you. It sits on top of the existing volume rocker, adding much-needed abilities such as advanced device control and the ability to pause the sound output from apps. Get it at <https://extensions.gnome.org/extension/212/advanced-volume-mixer/>.

Removing accessibility: The only downside of GNOME extensions is that the

majority of them sit on the GNOME panel. Adding too many will create unnecessary clutter there. You can remove unused extensions to save space. Accessibility is one that is hardly used, and so you can get rid of it to reclaim space for other valuable extensions. The `Remove Accessibility` extension does just that. Extension page: <https://extensions.gnome.org/extension/112/remove-accessibility/>.

To-do/Note taking: This is a no-nonsense note-taking application. You can add notes by entering the contents, and they can be removed by clicking on them. No fancy editing options, back-ups, dates, time or alarm. It's a simple clutter-free extension. If you need a simple notes extension, then this is for you. Extension page: <https://extensions.gnome.org/extension/162/todo-list/>.

Advanced Settings Center: This extension embeds an `Advanced Settings` option under the user menu, letting you access many system settings with just a few clicks—a very handy time-saver. Extension page: <https://extensions.gnome.org/extension/341/settingscenter/>.
