

in demand. Prabhu Ramachandran, managing director, Enthoughts, India, and a faculty member of IIT Mumbai, elaborates, “Python programs are generally expected to run slower than Java programs, but they also take much less time to develop. Developers can easily learn the language and express themselves effectively. The best part of Python is it can be readily connected with other languages. It will not be out of place to say that anyone who has a love for coding will definitely learn Python as a first language.” And what are the skills one must have to be a good Python expert? “Someone who cares about the quality of the code will certainly excel as a Python professional. So, the job prospects are extremely good for adept programmers as big ventures like Google, Dropbox, etc, hire IT professionals with expertise in this domain,” says Ramachandran.

Perl

An analysis of hiring trends has revealed that the demand for Perl experts in the workplace is on the rise. Rahul Soni, technical director, ThoughtBeat, Mumbai, reveals, “Perl, which has recently turned 25, when combined with CGI (Common Gateway Interface) scripting, becomes more powerful and can do wonders. In fact, it did gain momentum in the late 90s as a CGI scripting language. I would say that wherever there is no Web interaction, its performance is stupendous. If you talk about the salary trends, it is comparatively higher-than-average, but Perl may not be ideal for some applications, potentially limiting job prospects.”

Ruby on Rails

While languages like Python, PHP and Java are making

waves in the developer world, how does Ruby on Rails fare in the job market? Shubradeep Nandi, an expert trainer in E3 Infotech, Gurgaon, quips, “Ruby on Rails is indeed impressive and now robust in the market. Ruby on Rails can be more effective when combined with Javascript. It is very scalable and once developers use this language, they don't want to switch to any other. If you talk about the recruitment scene, I would say that it is in the growing phase in India, so it will take a few years to evolve as an independent language that can create millions of jobs in India. But yes, small and medium sized enterprises are hiring professionals who have expertise in this domain.”

Java

According to our Facebook survey, Java ranked second in the list. Explaining the reason for the popularity of Java, Neeraj Kumar, director, Tech Mentro, says, “The poll result was quite expected. Java is popular because of its wider acceptance. Whether it's the mobile or the desktop, Java is primarily used to build apps. So it naturally spells vast career opportunities for developers. Though other languages are making inroads in the developer domain, Java is very much here to stay. The career growth prospects, too, will be quite enduring, in the years to come.”
