

TIPS & TRICKS

Know your directory size

 At times, when clearing up server space, we may need to find the large-sized directories. For that, you can use any of the following commands. The first command listed assumes that the file sizes are in MB. If it's GB, of course, you have to replace M with G. This will help you to find out large sized directories.

```
du -sh * | grep M
```

To display the total size of all directories:

```
du -sch * | grep M
```

If you suspect it is a file taking up a lot of space, you may need to change the command to:

```
du -ah * | grep M
```

Getting back the start-up sound in OpenSUSE

 If you are a hard core GNOME user of OpenSUSE, like me, then you definitely miss the login/start up sound. Unlike Ubuntu, OpenSUSE does not have a login sound, by default. The login sound can be added by following the steps shown below.

Step 1: Rename your audio file as 'desktop-login'. The file format can be either .ogg or .oga file

Step 2: Now move your audio file to /usr/share/sounds/freedesktop/stereo/

You cannot do this until you gain a write permission of the folder. Open your terminal and type:

```
sudo chown -Rv username /usr/share/sounds/freedesktop/stereo/
```

Then press *Enter*. You'll be prompted for the root password, so provide it, or else just copy the audio file to /usr/share/sounds/freedesktop/stereo/ as a superuser.

Step 3: Restart your computer. It will play your

favourite sound now, while you log in to the system.

Packet capturing in Linux

 Here are a few simple tricks for using the *tcpdump* command.

To view the packets quickly:

```
tcpdump -qnp1 eth0
```

To view all the packets in ASCII format:

```
tcpdump -Annp1 eth0
```

To view all packets in the Hex and ASCII formats:

```
tcpdump -Xnp1 eth0
```

To view packets with the L2 layer:

```
tcpdump -eqnp1 eth0
```

To save the captured packets:

```
tcpdump -qnp1 eth0 -w capture.pcap
```

capture.pcap can be opened using the famous tool *Wireshark*.

Share the terminal session

 Most Linux distributions have *Screen* already installed. If not, then install using *apt-get* OR *yum*. Now to share your terminal type, issue the following command:

```
screen -S screen-name
```
