Yogesh Jadhav: Download the latest version of Ubuntu at <http://www.ubuntu.com/download/desktop> from here and you get help from here <https://help.ubuntu.com/>

**Gothi Narendra:**

Is it possible to use MS Office 2010, driver of Lenovo Z570, and game Zuma Revenge of Lenovo laptop for Linux mint?

Benson Shaji: I wouldn't recommend it. Even if it possible with software called Wine, it's not efficient or you may not expect the same results as it was in Windows.

Vishal El Mono: Yes. Please download Wine software. This will help you to install .exe files in Linux.

Spencer Allen: <http://wine-review.blogspot.com/2012/02/how-to-install-microsoft-office-2010-on.html>. I've never tried a driver but chances are you don't need to. I recommend Linux Mint to new users.

**Sunil Malviya:**

How to delete wine extract files in CentOS 6.3? Wine setup already extracted in CentOS 6.3 by root account. Give me suggestions.

Riya Patankar: Are you installing wine? Try this yum -y install wine.

Sunil Malviya: Yes, I installed wine in root account, but there was an error that showed switch to other user account.

Samantha de Lucio: When an user runs wine for the first time, a directory named .wine is created in their home directory. The users home directories are usually stored in /home. The home dir of the root account is not stored in /home but in /root. In order to find and delete files, you have to login as root and look in the /root/.wine folder.

Sunil Malviya: So, how to enter in root account with GUI?

Yogesh Jadhav: If you know root user password then you easily enter to root user just type this command \$su - if you don't know root password then boot into single user mode and then configure root password.

**Julius Steponavicius:**

Hi, I'm thinking of trying one of the Linux OS on one of old laptops since it has a lack of good performance, and I wanted to ask for some help to find the best one for me. I have an old laptop IBM thinkpad T23. The main questions I have about Linux are about problems with drivers, or let's say - emulation of some Windows software like Adobe cs3. Tech specs of the laptop are: Intel Pentium III - 1.2 GHz, 512 MB RAM, 16 MB video card. Thank you for your time.

Spencer Allen: Linux Mint mate would work fine and that's what I recommend to new users. It will probably recognize all of the hardware and install the appropriate drivers during the install. Unfortunately your laptop doesn't meet the minimum system requirements for Adobe cs3 so even if you could get it installed using an emulator like wine chances are it would not run well. So I would suggest using the open source equivalents to the Adobe apps that are packaged in the creative suite. For instance Gimp is a close approximation to Adobe Photoshop but it's easier on the hardware requirements.

Julius Steponavicius: Great Thanks, I have found that Linux mint has a bunch of other versions, which one do you prefer? One guy from Yahoo answers suggested Linux Mint with an XFCE4 or LXDE. Which versions are these? (by number, 5 and 9th?)

Spencer Allen: Well here's what's available to download. <http://www.linuxmint.com/download.php>. I recommend Mate 32 bit XFCE and LXDE are different desktop environments so is Mate. For new users I recommend Mate. Here's some more information on the different desktop environments available for Linux. In case you want to try them out you can always install them after installing the OS then select the desktop environment you want to use when you log in.

Julius Steponavicius: Great, thanks man. One last question, do you think I should prepare some drivers before installing or should I not worry?

Spencer Allen: I've used Linux Mint on a similar laptop. It wasn't exactly the same model, Mine was a T42 but it installed all the drivers for me. I expect it to be the same for you.

Yogesh Jadhav: I think you can try Ubuntu 8.04 or 8.10. It was a good support to an old hardware and gives excellent graphics & performance.
