

Ubuntu arrives for touch phones

If you have a growing appetite for more news about the gadget world, here's something just for you. The power of touch has finally arrived to one of the most popular Linux distributions—Ubuntu. Canonical has officially introduced its 'Ubuntu for phones' operating system. This means Linux fans worldwide can now operate Ubuntu Linux from their smartphones. But users will have to wait till 2014 to get their hands on the first Ubuntu-based smartphone. Meanwhile, if you cannot wait to power your smartphone with Ubuntu, try Ubuntu for Android.

So, how is the UI of the 'Ubuntu for phone' OS different? Unlike Android, Ubuntu Phone OS doesn't include many screen buttons and depends mostly on edge swipes. According to the official website, "Your phone is more immersive, the screen is less cluttered, and you flow naturally from app to app with edge magic. The phone becomes a full PC and thin client when docked."

For developers, Ubuntu Phone OS supports both native and Web or HTML5 applications. Web apps are first class citizens on Ubuntu, with APIs that provide deep integration into the interface. "HTML5 apps written for other platforms can be adapted to Ubuntu with ease, and we're targeting standard cross-platform Web app development frameworks like PhoneGap to make Ubuntu 'just work' for apps that use them," according to the official posting.

Watch 100,000 movies and TV shows on your Android tablet

If you own an Android tablet, this news is sure to give you an adrenaline rush! Vudu for Android will now offer you access to entertainment content like never before. Over a year after its launch on iOS, Walmart-owned Vudu has finally opened up its library of movies and TV shows for Android users.

It means that Android device users will now be able to stream or download over 100,000 movies and TV shows on their tablet PCs.

The catch is that Vudu will only support tablet PCs running the Android 4.0 aka Ice Cream Sandwich OS or above. The Vudu for Android app can be downloaded from Google Play Store for free.

Once the app is downloaded and installed, users can download videos for offline viewing like they do on their PCs. The app

currently supports only tablet PCs and the company is not making any announcements about its availability on smartphones. According to reports, the list of supported devices will continue to grow soon. It is worth mentioning here that Vudu's Xbox360 app is also updated to support 1080p HDX streaming video.

Raspberry Pi rolls out its own app store!

The \$35 Raspberry Pi has just become more fun to own after the launch of Pi Store in December 2012. This app store offers free and paid applications and games for the small-sized computer. In other words, it is a 'one-stop shop for all your Raspberry Pi needs'.

The app store allows users to download software, raw code, tutorials, tools or games for the small-sized Linux computer. The idea behind the app store is to encourage young programmers and software developers to programme and create new apps. Making an announcement about the app store, the sources in the Raspberry Pi Foundation wrote in a blog post, "It's also an easier way into the Raspberry Pi experience for total beginners, who will find everything they need to get going in one place, for free."

Users can download the content from the store and upload their content for any moderations or release. Users who submit their content will be allowed to charge for it if they wish to. Even if the users opt to offer their 'work' for free, they will be open to receive donations or 'tips'. The Pi Store allows users to submit raw Python code, binaries, audio, video and images as well, unlike the other app stores. The Pi Store is also offering an updated version of Raspbian. Users need
