

Here comes the Kii keyboard app for Android

With the growing popularity of touchscreens, the use of keyboards has been on the wane. But keyboard users have reason to smile. Google has multiple keyboard apps available on its Play Store. This line-up is being led by Swype, then SwiftKey and it looks like Android users now have a couple of more options—the Slice and Kii keyboards as well.

The Kii app has been recently updated to version 1.2. The Kii keyboard offers features that include Swype-like gesture input and SwiftKey-like next word prediction. The app also supports 34 languages combined with themes, a split keyboard layout, font and colour customisation, an extra arrow key row, an extra number key row, and more.

On the compatibility front, the Kii Keyboard app supports any device that runs Android 2.1 or above, which sounds like good news for all those who still run their devices on stone-age Android versions across the globe. The Kii Keyboard is available for free and you can download it from the Google Play Store today!

Another exciting alternative to Kii is the Slice Keyboard app. This is an innovative touch keyboard design that allows users to touch and type on a touch screen. Slice's main innovation is a blank home row where you place your fingers. The keys are shown depending on which fingers are placed on the home row. Each key is in a direction relative to the keys on the home row. This allows you to type without having to look at the keys.

Bodhi Linux 2.2.0 released

If you have a fetish for lightweight distros, this one is for you. The version 2.2.0 of Bodhi Linux is out. This release includes the 'first Bodhi images to feature the stable E17 desktop'. A few new changes have been made in this release. According to a posting, "The Bodhi project will now be maintaining two 32-bit install discs: one that is PAE enabled by default and one that is not. The kernel without PAE will be an older stable kernel (in this case 3.2), while the PAE enabled kernel will be the latest - for 2.2.0 this means a 3.7 kernel. The 64-bit release also comes with the 3.7 kernel."

"These discs are also our first released images that are hybrid ISO images. This means that you can write the image directly to a flash drive simply using the dd command and it will become a bootable media. You no longer need to use unetbootin (unless you want to) to create bootable Bodhi flash drives," wrote Jeff Hoogland, Bodhi Linux developer, in a blog post.

Also included in these disc images are local copies of a newly updated Bodhi QuickStart and the Bodhi Guide to Enlightenment. Both these documents have been updated to showcase all the recent changes that have occurred with the stable E17 release.
