You'll find Filezilla good if you want to deploy your site, but your IDE lacks an in-built FTP client for deploying websites.

## 10. XAMPP

If you want to install a full LAMP or WAMP stack, it's hard to configure them all and get the site live. XAMPP has

changed this, with a simple easy-to-install Apache distribution containing MySQL, PHP and Perl for quickly setting up a development environment locally. XAMPP is supported on multiple operating systems: Windows, Linux, OS/X and Solaris. It is designed with the Web developer in mind, giving you the power and flexibility of a test Web server without the hassle of setting up a dedicated box running a special server operating system, just for site testing. When it comes to throwing a server out into the wild, however, proper hardened security is a must—and operating systems designed specifically for servers should be used for public-facing production sites, instead of XAMPP. My advice to anyone wanting to give XAMPP a spin would be: stay within the confines of an internal LAN and you should have no problems. **END**
