

```
#sum.bc
print "Enter a positive number: "
num = read()
sum = 0
current_num = 1
while (current_num <= num)
{
    sum += current_num
    current_num += 1
}
print "Sum of first ", num, " numbers is: ", sum, "\n"
quit
```

Code snippet for factorial.bc:

```
#factorial.bc
print "Enter a positive number: "
num = read()
product = 1
for (current_num = 1; current_num <= num; current_num += 1)
{
    product *= current_num
}
```

```
}
print "Product of first ", num, " numbers is: ", product, "\n"
quit
```

The above programs can be tried out by issuing shell commands `'bc -q sum.bc'` and `'bc -q factorial.bc'`, respectively. But, what are those two words, *print* & *read*, doing in the code? They are built-in functions, displaying a message to the user, and taking a number from the user, respectively. Functions? Yes, *bc* can do functions as well, but that will get covered in the next article. For now, just go ahead and try the above programs.

8 Xine

Xine is a multimedia player that, quite frankly, looks extraordinarily outdated. However, it supports a huge list of file formats, and can be used as a stand-alone multimedia engine for various media players. Didn't get me? Well, KDE's Kaffeine is built on it. Thus, Xine can double as a back-end multimedia engine as well as a fully functional front-end media player.

9 MPlayer

Is your OS or computer having problems with almost all major media players? Don't panic, and do not get angry. Just grab MPlayer. It is, unarguably, one of the most flexible media players for Linux, because it supports various system configurations, both new and old. Even though the player itself is simple, it can play through hardware MPEG decoders (in simple words: full-screen videos look extra awesome).

Also, MPlayer supports a huge list of file formats. If you don't believe me, just check them out here: <http://www.mplayerhq.hu/design7/info.html>

10 Clementine Music Player

Amarok underwent significant changes in its interface when version 2 was released. As with any software

overhaul, some people loved the changes and others hated them. The latter half decided to channel their 'hate' in a constructive manner and built Clementine, based on Amarok's source code.

Technically, Clementine is what you get when you port Amarok 1.4 to work with modern KDE devices. Once again, it is based on QT4 and is fast, nimble, swift and super efficient! When it comes to features, Clementine supports various Internet radio stations such as Spotify and Last.fm, and also allows you to play media files that you have uploaded to Google Drive. Clementine supports devices such as the iPod and smartphones, and apart from Linux, it also works on Windows and Mac OS.

With that, we come to the end of this article about media players for Linux. I hope you enjoy the list, and if you have a music player that you think deserves to be mentioned in this list, feel free to let me know at [sufyan\[at\]bravenewworld.in](mailto:sufyan[at]bravenewworld.in).
