

WebOS may now function as an Android app

If you thought WebOS has become obsolete, here is some news for you. Phoenix International Communications is putting in efforts to make the 'dead' operating system functional as a stand-alone Android app. This will allow Android enthusiasts to use WebOS as an app on their Android smartphones without having to modify the device. It means that users will be able to run both WebOS and the Android OSS simultaneously on their smartphones without booting into one OS or the other.

A glimpse of the project was first seen a couple of weeks back when WebOS was seen operating as an Android app. However, at that time, the app was not able to get past the lock screen step without crashing. The people working on the project have released a new video, which shows the progress of the app.

Mozilla gets Facebook messenger for Firefox

If you are a user of the Firefox browser, you can now chat away with your Facebook friends even when you are actually not on the site, thanks to the Mozilla developers who have officially announced the Facebook Messenger for the Firefox Web browser. The messenger is built on a new social API. According to the Mozilla blog, "Once you enable the feature, you'll get a social sidebar with your Facebook chat and updates, like new comments and photo tags. You'll also get notifications for messages, friend requests and more that you can respond to right from your Firefox toolbar."

The posting elaborated on the new service by stating, "Facebook Messenger for Firefox lets you chat with friends and stay connected with their updates wherever you go on the Web, without needing to switch between or open a new tab. You can chat with your friends and family while doing anything from shopping online for the perfect gift, cheering your team on in the big game, watching a video or just surfing the Web. Of course, if you're not feeling social, you can easily hide the sidebar or even disable the feature."

To experience this new feature, just upgrade to the latest Firefox Web browser and then visit the Facebook Messenger for the Firefox page and click 'Turn On'. Recently, Mozilla had added an MSN-customised version in its Firefox Web browser. Users can now have Microsoft's Bing search engine and MSN as their home page.

Gmail users can now send files up to 10 GB!

Sending a large attachment via email has always been a pipedream of sorts. But Google's new plan to do away with the 25 MB data cap and enhance the limit up to 10 GB via Google Drive integration has made this feasible. However, there is a big 'BUT'. You obviously cannot send a file of 10 GB on an e-mail. After the large file gets uploaded, Google will send a link to the recipients of the e-mail, which would allow them to download the file from the sender's Google Drive account.

The Google Drive integration would be available soon. Also, Google has updated its Gmail e-mail service, which comes with new search capabilities by filtering e-mails by size and date. The new update has a more flexible date
