

Facebook pushes employees to use Android smartphones

The craze for Android smartphones is not just confined to the geeks. The most 'liked' social networking website, Facebook, has also joined the bandwagon. If reports are to be believed, Facebook is asking its employees to say 'no' to Apple and switch on to Android smartphones.

Recently, Facebook designed a poster that indicated the growth of Android smartphones over iPhones and is asking people to switch to Android-powered handsets. The strange part is that Facebook used to give out iPhones to its employees earlier but now states that, "...the aim of the Android effort is apparently to improve functionality for the app, which has been criticised as slow, thin on useful features, and a drain on resources. The aim of this so-called dog-fooding, in which employees are encouraged to use their own products, would be to improve the Facebook experience on the smartphone platform with the largest market share."

Skype 3.0 arrives on Android tablets!

This piece of news is sure to give all Android users a high. Skype introduced its Android app for the modern UI when Google released Android 4.0 (ICS). The app, however, was not optimised for bigger screens until now.

Skype 3.0 for Android supports the tablet user interface and is for those who want to do voice chat and video conferencing from their Android tablets. Skype for Android phones worked perfectly, but there is nothing like having the option of running the software on tablets as well. The UI of Skype for tablets is a cross between Android's Holo UI and Skype's own style. Both come together to offer a great experience in terms of look and feel.

The new Skype also enables users to sign in with a Microsoft account. It even has an improved audio and a couple of bug fixes. Skype has not revealed too many details about the bug fixes though. The new Skype shows how far it has progressed from its first Android app version. The development is a welcome change for Android fans. You can download Skype for your Android tablet from Google Play Store.

Red Hat Enterprise Linux 6.4 Beta goes well with Microsoft

Red Hat has come up with a beta release of version 6.4 of Red Hat Enterprise Linux (RHEL). This version has improved security along with several new Microsoft-enabling features. Previously, version 6.3 was released with enhanced virtualisation scalability.

Version 6.4 includes support for Microsoft Hyper-V Linux drivers along with interoperability improvements with Microsoft Exchange, which Red Hat includes within the Evolution e-mail system in RHEL.

"We had previously planned to integrate Microsoft Hyper-V drivers," said Ron Pacheco, senior manager, Product Marketing, Red Hat, in a report. "As is our practice with all aspects of Red Hat Enterprise Linux, we wait for the code (including drivers) to be accepted into the upstream community before they can be introduced into Red Hat Enterprise Linux 5.9, and now in Red Hat Enterprise Linux 6.4."

The next major release from Red Hat Enterprise Linux (RHEL) Version 7 will reportedly be out in the second half of 2013.

The company aims to release a major new version of its OS every three years along with updates about every six months, said Jim Totten, vice
