

If you are working with an emulator, you can do the same thing by downloading the respective files to the location *Android/android-sdk/platform-tools/* and installing these from the command-line with the *adb install filename.apk* command.

Running the test program

By now, your Android device is ready to run your PHP scripts—just start *Menu* and launch

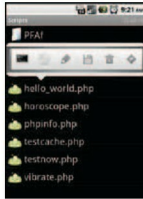

Figure 1: Demo scripts of PFA

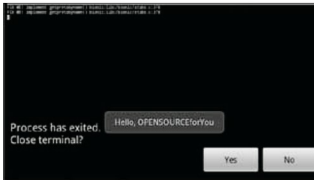

Figure 3: FIX ME error

SL4A. There you will find a number of demo scripts provided by PFA, as you can see in Figure 1. Let's run *hello_world.php*—just tap it, and then the pencil icon to edit the code, which is shown below:

```
<?php
require_once("Android.php");
$droid = new Android();
$name = $droid -> dialogGetInput("Hi!", "What is your name?");
$droid -> makeToast('Hello, ' . $name['result']);
```

As *getInput* is deprecated by Android, and will cause an error, you must use *dialogGetInput* instead. Once done, save and run the code. The result is shown in Figures 2 and 3. As you run the code, you will see a *FIX ME* error message (Figure 3 top) that reads:

FIX ME! implement `getprotobyname()` bionic/libc/stubs.c:378

This occurs because the *bionic* (Android *libc*) lacks *getprotobyname*. However, it does not affect the output of your script. When you pack your PHP script into an *apk* file, it gets removed. For further writing of your own scripts, you can refer to the SL4A API reference at <http://code.google.com/p/android-scripting/wiki/ApiReference>.

SL4A with PFA opens up Android development to the next level for Web developers, with definitely better programming opportunities while offering users more

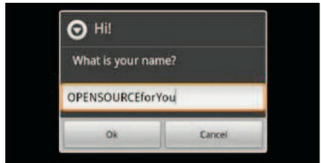

Figure 2: Run the changed 'Hello' script

flexible and interactive applications. So to all developers, happy coding!
