

Live Within Your Budget, With a Little Help From FOSS!

This article reviews a few simple yet effective open source financial management software that claim to help you to effectively manage your various transactions on a daily basis, while offering tips on how to plan better.

With the increase in the number of shopping malls, and the use of plastic money, one can easily lose track of how much is spent. Financial management has now become a necessity in this fast-paced world. And along with the growing use of gadgets and computers, no one would like to use ledger books or even simple notebooks. That's where financial management (FM) software comes in. There are many professional FM packages available that are designed to handle the finances of companies and other organisations, but in this article I'd like to introduce three open source personal finance

managers (PFMs) that can track your personal savings and expenses—Grisbi, Skrooge and Eqonomize.

Eqonomize

This is a KDE-based PFM. It is very simple software, with which you can create accounts, keep track of your expenses and income, make transactions from the various accounts you have created, and schedule transactions so that they occur automatically. There is also an option to keep track of investments in securities. Besides recording your transactions, you can set budgets for each category, and
